## PREFACE.

$\mathrm{M}^{5}$I readers will naturally ask why I have delayed writing this book for six years after my return; and I feel bound to give them full satisfaction on this point.

When I reached England in the spring of 1862, I found myself surrounded by a room full of packing-cases, containing the collections that I had from time to time sent home for my private use. These comprised nearly three thousand bird-skins, of about a thousand species ; and at least twenty thousand beetles and butterflies, of about seven thousand species; besides some quadrupeds and land-shells. A large proportion of these I had not seen for years; and in my then weak state of health, the unpacking, sorting, and arranging of such a mass of specimens oceupied a long time.

I very soon decided, that until I had done something towards naming and describing the most important groups in my collection, and had worked out some of the more interesting problems of variation and geographical distribution, of which I had had glimpses while collecting them, I would not attempt to publish my travels. I could, indeed, at once have printed my notes and journals, leaving all reference to questions of natural history for a future work; but I felt that this would be as unsatisfactory to myself, as it would be disappointing to my friends, and uninstructive to the public.

Since my return, up to this date, I have published eighteen papers, in the Transactions or Proceedings of the

Linnean Zoological and Entomological Sucieties, lescribing or cataloguing portions of my collections; besides twelve others in various scientific periodicals, on more general subjects connected with them.

Nearly two thousand of my Coleoptera, and many hundreds of my butterties, have been already described ly various eminent naturalists, British and foreign ; but a much larger number remans undescribed. Among those to whom science is most indebted for this laborious work, I must name Mr. F. P. Pascoe, late President of the Entomological Society of London, who has almost completed the classifitation and description of my large collection ol Longieorn beetles (now in his possession), comprising more than a thousand species, of which at least nine hundred were previously undescribed, and new to European calinets.

The remaining orders of insects, comprising probably more than two thousand species, are in the collection of Mr. William Wilson Saunders, who has caused the larger portion of them to be described by good entomologists. The Hymenoptera alone amounted to more than nine hundred species, among which were two hundred and eighty diflerent kimels of ants, of which two hundred were new.
The six years' delay in publishing my travels thus enables me to give, what I hope may be an interesting and instructive sketch of the main results yet arrived at by the study of my collections; and as the countries I have to describe are not much visited or written about, and their social and physical conditions are not liable to rapid change, I believe and lope that my readers will gain much more than they will lose, by not having read my book six years ago, and by this time perhaps forgoten all about it.

I nust now say a few words on the plan of my work.

My journeys to the various islands were remulated by the seatons and the means of conveyauce. I visited some islands two or three times at distant intervals, and in some eases had to make the same voyage four times over. A chronological arrangement would have puzzled my readers. They would never have known where they were; and my frequent references to the groups of islands, classed in accordance with the pecularities of their animal productions and of their human inhabitants, would have been hardiy intelligible. I have adopted, therefore, a geographical, zoological, and ethnological arrangement, passing from island to island in what seems the nost natural succession, while I transgress the order in which I myself visited them as little as possible.

I divide the Archipelago into five groups of islands, as follow:-
I. Tife Indo-Mhlay Islands: comprising the Malay Peninsula and Singapore, Bomeo, Java, and Sumatra.
II. Tife Thmor Group: comprising the islands of Timor, Flotes, Sumbaw, and Lombock, with several smaller ones.
IIL Celebes: comprising also the Sula Islands and Bouton.
IV. The Molccean Group: comprising Bouru, Ceram, Datchian, Gilolo, and Morty; with the smaller islands of Ternate, Tidore, Makian, Kaióa, Amboyna, Banda, Goram, and Matabello.
V. Tue Papuan Group: comprising the great island of New Guinea, with the Aru lslands, Mysol, Salwatty, Waigion, and several others. The Ké Islands are described with this group on accombt of their ethnology, though zoolngically and geon graphically they belong to the Moluccas.

The chapters relating to the separate islands of cach of these groups are followed by one on the Natural History of that group; and the work may thus be divided into five parts, each treating of one of the natural divisions of the Archipelago.

The first clapter is an introductory one, ou the Physical Geography of the whole region; and the last is a general sketeh of the Races of Man in the Archipelago and the surrounding countries. With this explanation, and a referenco to the Maps which illastrate the work, I trust that my readers will always know where they are, and in what direction they are going.

I am well aware that my book is far too small for the extent of the subjects it tonches upon. It is a mere sketeh; but so far as it goes I have endeavoured to make it an accurate one. Amost the whole of the narmative and deseriptive portions were written on the spot, and have had little more han verbal alterations. The chapters on Natural History, as well as many passages in other parts of the work, have been written in the hope of exciting an interest in the various questions connected with the origin of species and their geographical distribution. In some cases I have been able to explain my views in cletail; while in others, owing to the greater complexity of the subject, I have thought it better to confine myself to a statement of tho more interesting facts of the problem, whose solution is to be found in the principles developed by Mr. Darwin in his various works. The numerous Illustrations will, it is believed, add much to the interest and value of the book. They have been made from my own sketches, from platographs, or from specimens; and such subjects only have been chosen as would really illustrate the narrative or the descriptions,

I have to thank Messrs. Walter and Henry Woodbury,
whose acquaintance $I$ had the pleasure of making in Java, for a number of photographs of scenery and of natives, which have been of the greatest assistance to me. Mr. William Wilson Saunders has kinilly allowed we to figure the curious horned flies; and to Mr. Pascoe I am indelated for a loan of two of the very rare Longicorns which appear in the piate of Bornean heetles. All the other specimens figured ate: in my own collection.

As the main object of all my joumeys was to obitain specimens of natural history, both for my private collection and to supply duplicates to museums and amateurs, I will give a general statement of the nmmber of speeimens I collected, and which reachod home in good condition. I must premise that I generally empleyed one or two, and sometimes three Malay servants to assist me; and for thee fuars had the services of a young Englishman, Mr, Charles Allert. I was just eight years away from Emalaud, but as I travelled about fourteen thousand miles within the Amhipelago, and mate sixty or seventy seprate jouneys, ench involving some preparation and loss of time, I do not think that more than six yons were really oceupied in collecting.

I find that my Eastem collections amounted to :

125,600 specimens of natural history.
It now only remains for me to thank all those friends to whom I am indebted for assistance or information. My thanks are more especially due to the Council of the Royal

Geograplical Society, through whose valuable recommendations I obtained important aid from our own Government and from that of Holland; and to Mr. William Wilson Saunders, whose kind and liberal encouragement in the early portion of my journey was of great service to me. I am also greatly indebted to Mr. Samuel Stevens (who acted as my agent), both for the care he took of my collections, and for the untiring assiduity with which he kept me supplied, both with useful information, and with whatever necessaries I required.

I trust that these, and all other friends who have been in any way interested in my travels and collections, may derive from the perusal of my book, some faint reflexion of the pleasures I myself enjoyed amid the scenes and objecis it describes.

## MALAY ARCHIPELAGO.

## Chapter I.

## PIIYSICAL GEOGRAPHY.

$I^{F}$F we look at a glote or a map of the Eastern hemisphere, we shall purceive between Asia and Australia a number of large and small islands, forming a connected yroup distinet from those great masses of lanil, and having little comnexion with either of them. Situated upon the Equator, and bathed by the tepid water of the great tropical weans, this region enjoys a climate more uniformly hot and moist than almost any other part of the globe, and teems with natural productious which are elsewhere unknown. The richest of fruits and the most precious of spies are bere indigenous. It produces the giant flowers of the Taftlesia, the great green-winged Ornithoptera (princes among the butterfly tribes), the man-like Orang-Utan and the gorgeous Birds of Paradise. It is inhabited ly a peculiar and interesting race of mankind-the Malay, found nowhere beyond the limits of this insular tract, which has hence been named the Malay Arehipelago.

To the ordinary Englishman this is perhaps the least known part of the globe. Our possessions in it are few and scanty; scarcely any of our travellers go to explore it; and in many colleotions of maps it is almost ignored, being divided between Asia and the Pacific Islands. It thus happens that few persons realize that, as a whole, it is comparable with the primary divisions of the globe, and
that some of its separate islands are larger than France or the Austrian empire. The traveller, however; som acquires different ideas. He sails for days, or even for weeks, along the shores of one of these great ishands, often so great that its imhobitants believe it to be a vast continent. He finds that voyages among these islands are commonly reckoned by weeks and months, and that their several inhabitants are often as little known to each other as are the native races of the northern to those of the southera continent of America. He soon comes to look upon this region as one apart from the rest of the word witl its own races of men and its own asperts of nature; with its own ideas, feelings, customs, and modes of speech and with a climate, vegetation, and animated life alturethor peculiar to itself.

From many points of view these islants form one compact gecuraphical whole, and as such they have always been treated by travellers and men of science; lout a more careful and cletailed study of them under varfous aspects, reveals the unexpected fact that they are divisible into two portions nearly equal in extent, which widely differ in their natural products, and really form parts of two of the primary divisions of the earth. I have been able to prove this in considerable detail by my observations on the natural history of the various parts of the Archipelago; and as in the description of my travels and residence in the several islands I shall have to reler continually to this view, and adduce facts in support of $i t$, I have thought it iulvisable to commence with a general sketch of such of the main features of the Malayan region as will render the lacts hereafter brought forward more interesting, and their bearing on the general question more easily understood. I proceed, therefore, to sketch the limits and extent of the Archipelago, and to point out the more striking features of its geology, physical geography, vegretation, and animal life.

Definition and Boundaries.-For reasons which dopend mainly on the distribution of animal life, I consider the Malay Archipelago to include the Malay Peninsula as far as Tenasserim, and the Nicobar Islands on the west, the lhilippines on the north, and the Solomon lslands beyond

New Guinea, on the east. All the great islands included within these limits are connected together by innumerable smaller ones, so that no one of them seems to be distinctly separated from the rest. With but few exceptions, all enjoy an uniform and very similar climate, and are covered with a luxuriant forest vegetation. Whether we study their form and distribution on maps, or actunlly travel from island to island, our first impression will be that they form a connected whole, all the parts of which are intimately related to each other.

Eatent of the Archipclago and Islomds.-The Malay Archipelago extends for more than 4,000 miles in length from cast to west, and is about 1,900 in lneadth from north to south. It would stretch over an expanse equal to that of all Europe from the extreme west far into Central Asia, or would cover the widest parts of South America, and extend far beyond the land into the Pacitic aud Atlantic oceans. It includes three islands larger than Great Britain ; and in one of them, Borneo, the whole of the Pritish Isles might be set down, and would be surrounded by a sea of forests. New Guinea, though less compact in shape, is probably larger than Bornco. Sumatra is about equal in extent to Great Britain; Java, Luzon, and Celcbes are each about the size of Ireland. Ejghteen more islamls are, on the average, as large as Jamaica; more than a hundred are as large as the Isle of Wight; while the isles and islets of smaller size are innumerable.

The ahsolute extent of land in the Archipelago is not greater than that contained by Western Europe from Hungary to Spain; but, owing to the manner in which the land is lnoken up and divided, the variety of its prohnetions is rather in proportion to the immense surface over which the islands are spread, than to the quantity of land which they contain.

Geological Comtrasts.-One of the chief volcanic belts upon the globe passes through the Archipelago, and produces a striking contrast in the scenery of the voleanic and non-volcanic islands. A curving line, marked out by scores of active and hundreds of extinct volcanoes, may be traced through the whole leneth of Sumatra and Java, and thence by the islants of Bali, Lombock, Sum-
buwa, Flores, the Serwatty Islands, Banda, Amboyna, Batchian, Makian, Tidore, Ternate, and Gilolo, to Morty Island. Here there is a slight but well-marked break, or shift, of about 200 miles to the westward, where the voleanic belt again begins, in North Celebes, and passes

THE BELTAEL ISLEH ANH HOLSEO ON TILE SAME RCMIE.
by Siau and Sanguir to the Philippine Islands, along the eastern side of which it continues, in a curving line, to their northern extremity. From the extreme castern bend of this belt at Banda, we pass onwards for 1,000 miles over a non-volcanic district to the volcanoes observed by Dampier, in 1699, on the north-eastern coast of New

Guinea, and can there trace another voleanic belt, through New Britain, New Ireland, and the Solomon Islands, to the eastern limits of the Arehipelago.

In the whole region occupied by this vast line of volcamos, and for a considerable breadth on each side of it, earthquakes are of contimual recurrence, slight shocks beiny felt at intervals of every few weeks or months, while more severe ones, shaking down whole villages, and doing more or less injury to life and property, are sure to haprea, in one part or another of this district, almost every year. In many of the islands the years of the great carthquakes form the chronological epochs of the native inhabitants, by the aid of which the ages of their children are remembered, and the dates of many important events are determined.

I cau only briefly allude to the many fearful eruptions that have taken place in this region. In the amount of injury to life and property, and in the magnitude of their effects, they have not been surpassed by any upon recort. Forty villages were destroyed by the eruption of lapandaYang in Java, in 1772, when the whole mountain was blown up by repeated explosions, and a large lake left in its place. Iy the great eruption of Tomboro in Sumbawa, in 1815 , 12,000 people were destroyed, and the ashes darkened the air and fell thickly upon the earth and sea for 300 miles round. Even quite recently, since I quitted the country, a mountain which had been quiescent for more than 200 years suldenly burst into activity. The island of Makian. one of the Moluceas, was rent open in 1646 by a violent muption, which left a huge chasm on one side, extending into the heart of the mountain. It was, when I last visited it, in 1860, clothed with vegetation to the summit, and contained twelve populous Nray villages. On the 29 th of December, 1862 , after 215 years of perfect inaction, it again suddenly burst forth, blowing up and completely altering the appearance of the mountain, destroying the greater part of the inhabitants, and sending forth such volumes of ashes as to darken the air at Temate, forty miles off', and to almost entirely destroy the growing crops on that and the surrounding islands.

The island of Java contains more volcanoes, active and extinet, than any other known district of equal extent.

They are about forty-five in number, and many of them exhibit most beautiful examples of the volcanic cono on a large scale, single or double, with entire or truncated summits, and averaging 10,000 feet high.

It is now well ascertained that almost all voleanoes have been slowly built up by the accumulation of matter -mud, ashes, and lava-ejected by themselves. The openings or craters, however, frequently shift their position; so that a country may be covered with a more or less irregular series of hills in chains and masses, only here and there rising into lofty cones, and yet the whole may be produced by true volcanic action. In this manner the greater part of Java has been formed. There has been some elevation, especially on the south coast, where extensive cliffs of coral limestone are found; and there may be a substratum of older stratified rocks; but still essentially Java is volcanic; and that noble and fertile island-the very garden of the East, and perhaps upon the whole the richest, the best cultivated, and the best governed tropical island in the world - owes its very existence to the same intense volcanic activity which still occasionally devastates its surface.

The great island of Sumatra exhibits in proportion to its extent a much smaller number of volcanoes, and a considerable portion of it has probably it non-volcanic origin.

To the eastward, the long string of islands from Java, passing by the uorth of Twor aud away to Banda, are probably all due to volcanic action. Timor itself consists of ancient stratified rocks, but is said to have one voleano near its centre.

Going northward, Amboyna, a part of Boum, and the west end of Cermm, the north part of Gilolo, and all the small islands around it, the northern extremity of Celebes, nud the islands of Siau and Sanguir, are wholly voleanic. The l'hilippine Archipelago contains many active and extinct volcanoes, and has probably bera reduced to its present fragmentary condition by subsidences attendins on voleanic action.

All along this great line of volcanoes are to be found nore or less palpable signs of upheaval and depres-
sion of land. The range of islands south of Sumatra, a part of the south coast of Java and of the islands east of it, the west and east end of Tiroor, portions of all the Moluccas, the Ke and Aru Islands, Waigion, and the whole south and east of Gilolo, consist in a great measure of upraised coral-rock, exactly corresponding to that now forming in the auljacent seas. In many places I have olservel the maltered surfaces of the elevated reefs, with great masses of coral standing up in their natural position, and hundreds of shells so fresh-looking that it was hard to believe that they had been more than a few years out of the water; and, in fact, it is very probalise that such changes have occurred within a few centuries.

The united lengths of these volcauic belts is about ninety degrees, or one-fourth of the entire circumference of the globe. Their width is about fifty miles; but, for a space of two hundred on each side of them, evidences of subterranean action are to be found in recently elevated roral-rock, or in barier coral-reefs, indicating recent submergence. In the very centre or focus of the great curve of volcanoes is placel the large jsland of Borneo, in which no sign of recent woleanic action has yet been observed, and where earthquakes, so characteristic of the surrounding regions, are entirely unknown. The equally lawe island of New Guinea occupies another quiescent area, on which no sign of voleanie action has yet been discovered. With the exception of the castern end of its nothern jeninsula, the large and curiously-shaped ishand of Celebes is also entirely free from volcanoes; and there is some reason to believe that the volennic portion has once formed a separate island. The Malay Peninsula is also monvoleanie.

The first and most obvious division of the Archipelago would therefore be into quiescent and volennic regions, and it might, perhaps, be expected that such a division would correspond to some differences in the character of the vegetation and the forms of life. This is the case, however, to a very limited extent ; and we shall presently see that, although this development of subterranean fires is on so vast a scale,-las piled up chains of mountains ten or twelve thousand feet high-has broken up conti-
nents and raised up islands from the ocean,-yet it has all the character of a recent action, which has not yet succeeded in obliterating the traces of a more ancient distribution of land and water.

Contrasts of Vegctation.-Placed immediately upon the Equator and surrounded by extensive oceans, it is not suprising that the varions islands of the Archipelago should be almost always clothed with a forest vegetation from the level of the sea to the summits of the loftiest mountains. This is the general rule. Sumatra, New Guinea, Borneo, the Philippines and the Moluceas, and the uncultivated parts of Java and Celebes, are all forest countries, except a few small and unimportant tracts, due perhaps, in some cases, to aucient cultivation or necidental fires. To this, however, there is one important exception in the island of Timor and all the smaller islands aroun! it, in which there is absolutely no forest such as exists in the other islands, and this character extemls in a lessed degree to Flores, Sumbawa, Lombock, and Bali.

In Timor the most common trees are Eucalypti of several species, sio characteristic of Australia, with sandalwood, acacia, and other sorts in less abundance. These are seattered over the country more or less thickly, but never so as to deserve the name of a forest. Coarse and seanty grassics grow beneath them on the more barren hills, and a luxuriant herbage in the moister localities. In the islands between Timor and Java there is often a more thickly wooded country, abounding in thomy and prickly trees. These seldom reach any great height, and during the force of the dry season they almost completely lose their leaves, allowing the groumd beneath them to be farched up, and contrasting strongly with the damp, glomy, ever-verdant forests of the other islands. This peculiar character, which extends in a less degree to the southern peninsula of Celebes and the east end of Java, is most probably owing to the proximity of Australia The south-east monsoon, which lasts for about two-thirds of the year (from March to November), Llowing over the northern parts of that country, produces a degree of heat and dryness which assimilates the vegetation and physieal aspect of the adjacent islauds to its own. A little further

[^0]eastward in TYimor-laut and the Ké Islands, a moister climate prevails, the somth-east winds blowing from the Pacifie through Torres Straits and over the damp forects of New Guinea, and as a consequence every rocky islet, is clothed with verdure to its very summit. Further west again, as the same dry winds blow over a wider and wider extent of ocenn, they have time to absorb fresh moisture, and we accordingly find the islaud of Java possessing a less and less arit climate, till in the extreme west near batavia rain occurs more or less all the year round, and the mountains are everywhere clothed with forests of mexampled luxuriance.

Contrasta in Depth of Sea.-It was first pointed out ins Mr. George Windsor Earl, in a paper read before the Royal (ieograpthical Socicty in 1845, and subseruently in a paruphlet "On the I'hysical Geography of Soull-Eastern Asia and Australia," dated 1850, that a shatlow sea connected the great islands of Sumatra, Jawa, and Bornen with the Asiatic continent, with which their natural productions generally arreed; while a similar slathow sta connected New Guinea nud some of the adjacent ishands to Australia, all being characterisad by the presence of marsupials.

We have here a clue to the most radieal eontrast in the Archipelaro, and by following it out in detail 1 have arrivel at the conclusion that we can draw a line amons the islands, which shall so divide them that one-halt slatil truly belong to Asia, while the other shall no less certainly be allied to Australia. I term these respectively the Indo-Midayan, and the Austro-Milayau divisions of the Archipelago. (Sce Physical-Map.)

On referring to pages 12,13 , and 36 of Mr. Earl's pamphlet, it will be seen that he maintains the former connexion of Asir and Australia as an important part of his view, whereas I dwell mainly on their long continned separation. Notwithstanding this and other mportant difierences letween us, to him undoubtedly belongs the merit of first indicating the division of the Arclipelaw into an Anstralian and an Astatic region, which it has been my good fortune to establish by more detailed observations.

Contrasts in Natural Productions.-To understand the importance of this class of fiects, and its bearing upon the former distribution of land and sea, it is necessary to consider the results arrived at by geologists and maturalists in other parts of the world.

It is now generally almitted that the present distribution of living things on the sufface of the earth is mainly the result of the last series of changes that it has undergone. Geolocy teaches us that the surface of the han and the distribution of land and water is everywhere slowly changing. It further teaches us that the forms of life which inhabit that surface have, during every prion of which we possess any record, been also slowly changing.

It is not now necessary to say anything about how either of those changes took place; as to that, opinions may differ; but as to the fact that the changes themselves have occurred, from the earliest geological ages down to the present day, and are still going on, there is no ditference of opinion. Every successive stratum of sedituentary rock, sand, or gravel, is a proof that changes of Jevel have taken place ; and the different species of animals and plants, whose remains are found in these deposits, prove that corresponding changes did occur in the organic world.

Taking, therefore, these two series of changes for granted, most of the present pecularities and anomalies in the distribution of species may be directly traced to them. In our own islands, with a very few trifling exceptions, every quadruped, lird, reptile, insect, and plunt, is found also on the adjacent continent. In the small islands of Sardinia and Corsica, there are some quadrupeds and insects, and many plants, quite peculiar. In Ceylon, more closely conneeted to India than Britain is to Europe, many animals and plants are different from those found in lndia, and peculiar to the island. In the Galapagos Islauts, almost every indigenous living thing is peeuliar to them, though closely resembling other kinds found in the nearest parts of the American continent.

Most naturalists now admit that these facts can only be explained by the grenter or less lapse of time since
the islands were upraised from benenth the ocean, or were separated from the nearest land; and this will be gencrally (though not always) indicated by the depth of the intervening sea. The enormous thickness of many marine deposits through wide areas shows that subsidence has often continued (with intermitting periods of repose) during epochs of immense duration. The depth of sea produced by such subsidence will therefore generally be a measure of time; and in like manner the change which organic forms have undergone is a measure of time. When we make proper allowance for the continued introduction of new animals and plants from surrounding countries, by those natural means of dispersal which have been so well explained by Sir Charles Lyell and Mr. Darwin, it is remarkable how closely these two measures correspond. Britain is separated from the continent by a very shallow sea, and only in a very few cases have our animals or plants begun to show a difference from the corresponding continental species. Corsica and Sardinia, divided from Italy by a much deeper sea, present a much greater difference in their organic forms. Cuba, separated from Yucatan by a wider and deeper struit, differs more markedly, so that most of its productions are of distinct and peculiar species; while Madagascar, divided from Atrica by a deep channel three hundred miles wide, possesses so many peculiar features as to indicate separation at a very remote antiquity, or even to render it doubtful whether the two countries have ever been absolutely united.

Returning now to the Malay Archipelago, we find that all the wide expanse of sea which divides Java, Sumatra, and Borneo from each other. and from Malacea and Siam, is so shallew that ships can anchor in any part of it, since it rarely exceeds forty fathoms in depth; and if we go as far as the line of a hundred fathoms, we shall include the I'hilippiue Islands and Bali, east of Java. If, therefore, these islands have been separated from each other and the continent by subsidence of the intervening tracts of land, we should conciude that the separation has been comparatively recent, since the depth to which the land has subsided is so small. It is alsu to be remarked, that
the great chain of active volcanoes in Sumatra and Java furnishes us with a suflicient cause for such subsidence, since the enmmous masses of matter they have thrown out would take away the fomdations of the surrounding district; and this may be the true explanation of the often-noticed fiet, that volcanoes and volcanic chains are always near the sea. The subsidence they prolnce aroum them will, in time, make a sea, if one does not already exist.

But it is when we examine the zoology of these countries that we find what we must require-evidence of a very striking chatacter that these great islands must have onere formed a part of the continent, and could only have been separated at a very recent geological epoch. The elephant and tapir of Sumatra and Borneo, the rhinoceros of Sumatra and the allied species of Java, the wild cattle of Bormeo and the kind long supposed to be peculiar to Java, are now all known to inhabit some part or other of Southern Asia. None of these large animals couhd possilly have passed over the arms of the sea which now separate these countries, and their presence plainly indieates that a land communication must have existed sunce? the origin of the species. Among the smaller mammals a considerable portion are common to each island and the continent ; but the vast physical changes that must have oceurred during the breaking up and subsidence of sueh extensive regions have led to the extinction of some in one or more of the islands, and in some cases there seems also to have hem time for a change of species to have taken place. Birls and insects dilustrate the same view. for every family, and almost cerery geuus of these groups found in any of the islands, oceurs also on the Asiatic coutinent, and in a great number of cases the species are exactly identical. Birds olfer us one of the hest means of determining the law of distribution; for though at first sight it would appear that the watery boundaries which keep out the land quadrupeds could be casily passed over by birds, yet pratically it is not so; for if we leave out the aquatic tribes which are preeminently wanderers, it is foum that the others (and especially the l'asseres, or true perching-birds, which form
the vast majority) are gencrally as strictly limited by straits and arms of the sea as are pualrupeds themselves. As an instance, among the islands of which I am now speaking, it is a remarkable fact that Java possesses numerous birds which never pass over to Sumatra, though they are separated by a strait only filteen miles wide, and with islands in mid-channel. Java, in fact, possesses more birds and insects peculiar to itself than either Sumatra or Borneo, and this would indicate that it was earliest separated from the continent; next in organic indisi cluality is Borneo, while Sumatra is so nearly identical in all its animal forms with the peninsula of Malacea, that we may safely conclude it to have leeen the most recently dismembered island.

The general result therefore at which we arrive is, that the great islands of Java, Sumatra, and Borneo resemble in their natural productions the adjacent parts of that continent, almost as much as such widely-separated districts could be expected to do even if they still formand it part of Asia; and this close resemblance, joined with the fact of the wide extent of sea which separates then being so uniformly and remarkably shallow, and lastly, the existence of the extensive ratuge of volcanoes in Sumatra and Java, which have poured out vast quantities of subtertuen matter and have built up extensive plateax and lofty momatain ranges, thus furnishing a rea couse for a parallel line of subsidence-all lead iressistibly to the conclusion that at a very recent gealogical epoch the continent of Asia extended fir beyond its present limits in a sonth-easterly direction, including the islands of Java, Sumatra, and Borneo, and probably reaching as far as the present 100 -fathom line of soundings.

The Philippine Islands agree in many respects with Asia and the other islands, but present some anomalies, which seem to indicate that they were separated at an earlier period, and have since been subject to many revolutions in their physical geography.

Tuming our attention now to the remaining portion of the Archipelago, we shall find that all the islands from Celebes and Lombock eastwarl exhibit almost as close a resemblance to Australia and New Guinea as the Western

Islands do to Asia. It is well known that the natural Irouluctions of Australia difler from those of Asia more than those of any of the fom ancient quarters of the work dither from each other. Australia, in fact, stands alone: it possesses no apes or monkeys, no cats or tigers, wolves, bears, or hyenas; no deer or antelopes, sheep or oxen ; no elephant, horse, squirrel, or rabbit; none, in short, of those familiar types of quadruped which are met with in every other part of the world. Instead of these, it has Marsupials only, kangaroos and opossums, wombats and the duck-billed Platypus. In birds it is almost as preculiar. It has no woodpeckers and no pleasants, families which exist in every other part of the world; but instend of them it has the mound-making brush-turkeys, the honeysuckers, the cockatoos, and the brush-tongued lories, which are found nowhere else upon the globe. All these striking peculiarities are found also in those islands which form the Austro-Malayan division of the Archipelago.

The great contrast between the two divisions of the Archipelago is nowhere so ahruptly exhibited as on passing from the ishand of Bali to that of Lomboek, where the two regions are in closest proximity. In Lhali we have barbets, fruit-thrushes, and woodpeekers; on passing over to Lombock these are seen no more, but we have abondance of cockatoos, homeysuckers, and lorush-turkeys, which are equally unknown in Bali, ${ }^{1}$ or any island further west. The strait is here lifteen miles wide, so that we may puss in two homs from whe great division of the earth to atmother, differing as essentially in their animal life as Europe does from America. If we travel from Java or Burneo to Celebes or the Moluceas, the difference is still more striking. In the tirst, the forests abound in monkeys of many kinds, wild cats, deer, civets, and otters, and numerons varieties of squirsels are constantly met with. In the latter nowe of these occur; but the prehensiletailed Cusens is almonst the only terrestrina mammal seen, except wild pigs, which are found in all the islands, and

[^1]deer (which have probably been recently introducel) in Celebes ant the Molucas. The birds which are most abundant in the Westem Islands are woodpeckers, barbets, trogons, fruit-thrushes, and leaf-thrushes: they are seen daily, and form the great ornithological features of the country. In the Eastern Islands these are absolutely unknown, honeysuckers and small lories beding the most common birls; so that the naturalist feels himself in a new wordd, and can hardly realize that he has passed from the one region to the other in a few days, without ever being out of sight of land.

The inference that we must drow from these facts is undoubtedly, that the whole of the islands eastwards heyond Java and Bomeo do essentially form a part of a former Australian or Pacitie coutinent, although some of them may never have been actually joined to it. This coutinent must have been broken mp not only before the Western Islands were separated from Asia, hut probably before the extreme south-eastern portion of Asia was raised atoove the waters of the ocean; for a great part of the land of Bomeo and Java is known to be geologically of quite recent formation, while the very great difterence of species, and in many cases of genera also, between the profuctions of the Eastern Malay Islands and Australia, as well as the great depth of the sea now separating them, all point to a comparatively long period of isolation.

It is interesting to observe among the islands themselves, how a shallow sea always intimates a recent bandconnexion. The Aru Islands, Mysol, and Waigiou, as well as Jobie, agree with New Guinea in their species of mammalia and birds much more closely than they do with the Moluccas, and we find that they are all united to New Guinea by a shatlow sea. In fact, the 100 -fathom line round New Guinca marks out accurately the range of the true Paradise birds.

It is further to be noted-and this is a very interesting point in connexion with theories of the dependence of special forms of life on external conditions-that this division of the Arehipelago into two regions characterised hy a striking diversity in their natural productions, does not in any way correspond to the main physical or
elimatal divisions of the surface. The great volcanic chain runs through both parts, and appears to produce no effect in assimilating their productions. Borneo closely resembles New Guinea not only in its vast size and its freedom from volcanoes, but in its variety of geological structure, its uniformity of climate, and the general aspect of the forest vegetation that clothes its surface. The Moluccas are the counterpart of the lhilippines in their volcanic structure, their extreme fertility, their luxuriant forests, and their frequent carthquakes; and Bali with the east end of Java has a climate almost as dry and a soil almost as arid as that of Timor. Yet between these corresponding groups of islands, constructed as it were after the same pattern, subjected to the same climate, and bathed by the same oceans, there exists the greatest possible contrast when we compare their animal productions. Nowhere does the ancient doctrine-that difierences or similarities in the various forms of life that inhabit different countries are due to corresponding pliysical differences or similarities in the countries themselves-meet with so direct and palpable a contradiction. Borneo and New Guinea, as alike physically as two distinct countries can be, are zoologically wide as the poles asunder; while Australia, with its dry winds, its open plains, its stony deserts, and its temperate climate, yet produces birds and yuadrupeds which are closely related to those inlabiting the hot damp Inxuriant forests which everywhere clothe the plains and mountains of New Guinea.

In order to illustrate more clearly the means by which I suppose this great contrast has been bronght about, let us consider what would occur if two strongly contrasted divisions of the earth were, by natural means, brought into proximity. No two parts of the world differ so radically in their productions as Asia and Australia, but the difference between Africa and South America is also very great, and these two regions will well serve to illustrate the question we are considering. On the one side we have baboons, lions, elephants, buffaloes, and giraffes; on the other spider-monkeys, pumas, tapirs, ant-eaters, and sloths; while among birds, the hornbills, turacos, orioles, and honeysuckers of Atrica contrast strongly with
the toncans, macams, chatterers, and lumming-birds of America.

Now let us endeavour to imagine (what it is very probable may occur in future arges) that a slow upheaval of the bed of the Atlantic should take place, while at the same time earthquake-shocks and volcanic action on the land should cause increased volumes of sedinent to be poured down by the rivers, so that the two enntinents should gradually spread out by the addition of newlyformed lands, and thats reduce the Atlantic which now separates them to an arm of the sea a fow lundred miles wide. At the same time we may suppose islands to be upheared in mid-channel; and, as the subterrancan forces varied in intensity, and shifted their points of createst action, these islands would sometimes become connected with the land on one side or other of the strait, and at other times again be separated from it. Several islands would at one time be joined together, at another would be broken up again, till at last, after many long ages of stuch intermittent action, we might have an irregular archipelago of islands filliug up the ocean channel of the Athatie, in whose appearance and arragement we couhd discover nothing to tell us which had been connected with Africa and which with America. The amimals and plants inhabiting these islauds would, however, certainly reveal this portion of their former history. On those islands which hat ever formed a part of the South American continent we should be sure to find such common birds as chatterers and toncans and humming-hirds, and some of the peeuliar American quadrupeds; while on those which had been separated from Africa, hornbills, orioles, and honeysuckers would as certainly be found. Some portion of the upraised land might at different times have had a temporary connexiou with both continents, and would then contain a certain amount of mixture in its living iuhabitants. Such seems to have been the case with the islands of Celebes and the Philippines. Other islands, again, though in such close proximity as Bali and Lombock, might each exhibit an almost unmixed sample of the productions of the continents of which they had directly or indirectly once formed a part.

In the Malay Archipelago we have, I believe, a case exactly parallel to that which I have here supposed. We have indications of a vast continent, with a peculiar fauna and flora, laving been gradually and irremularly broken up; the island of Celebes protally marking its furthest westward extension, beyond which was a wide ocean. At the sume time Asia appears to have been extending its limits in a south-east direction, first in an unbroken mass, then separated into islands as we now see it, and alnowt coming into actual contact with the scattred fragments of the great southern land.
From this outline of the subject, it will be evident how important an adjunct Natural IIstory is to Geology; not ouly in interpreting the fragments of extinct animals found in the earth's crust, but in determining past changes in the surface which have left no geological record. It is certainly a wonderinl and unexpected fact, that an accurate knowledge of the distribution of birds and insects should evable us to map out lamds and continents which disappeared beneath the ocan long before the earliest traditions of the human race. Wherever the geologist ean explore the carth's surface, he can read moch of its past history, and can deternine alluroximately its latest movements above and below the sea-level; lut wherever oceans and seas now extend, he ean do nothing but speculate or the very limited data affordel by the depth of the waters Here the maturalist steps in, and enables him to fill up this great gap in the past history of the earth.

One of the chicf objects of my travels was to obtain evidence of this nature; and my search after such evidence has been remarded by great success, so that I have been cmabled to trace out with some probability the past changes which one of the most interesting parts of the earth has undergone. It may be thought that the facts and generalizations here given, would have been more appropriately placed at the end rather than at the beginning of a narrative of the travels which supplied the facts. In some cases this might be so, hot I have found it impossible to give such an account as I desire of the natural history of the numerous islinds and groups of islands in the Archipelago, without constant reference to these gene.
ralizations which adk so much to their interest. Having given this general sketch of the sulgect, I shall be able to show how the same principles can be applied to the individual islands of a group as to the whole Archipolaro; and make my account of the many new and onfons animals which inhanit then both more interesting mat nome instructive than if treated as mere isolated facts.

Contrasts of Races.-Defore I had arrived at the conviction that the eastern and western hatues of the Arehinelano letonged to distinct prinaty regisis of the math, I had bren led to gromp the matives of the Archipelago under two radicatly distinct races. In this I differed from most - thandonists who had before written on the subject; for it had bect the almose universal rustom to follow Willim von Inumboldt and Pritchard, in classing all the Oceanic maces as modifications of one type. Olservation som showed me, however, that Malays and Papuans difieserd walically in every physical, mental, and moral character; and more detailed research, continacd for eight years, satisfied me that under these two forms, as types, the whole of the periples of the Malay Archipelago and Iolynesia could be classified. On drawing the line which separates these races, it is fomud to conse near to that which divides the zoological regions, but somewhat eastward of it; is rircumstance which appears to me very significant of the same canses having influenced the distribution of mankind that lave determined the range of other animal forms.

The reason why exatly the same line does not limit both is sulticiently intelligille. Man has means of triversing the sea which muimats do not possess; and it superion race has pown to press out or assimilate an inferior one. The maritime chterprise and higher civilization of the Nalay races hatre ehabled them to overun a portion of the atfacent rugion, in which they bave entirely supplanted the infligemons inlabitants if it ever possessed auy; and to spread much of their language, their domestic animals, and their customs far over the Pacife, into islands where they have but slightly, or not at all, modified the physien or moral characteristics of the people.

I believe, therefore, that all the peoples of the various islunds can be grouped cither witle the Malays or the Papuans; and that these two have no traceable affinity to each other. I believe, further, that all the races east of the line I have drawn have more affinity for each other than they have for any of the races west of that line; that, in fact, the Asiatic races include the Malays, and all have a continental origin, while the Pacific races, including all to the east of the former (except perhaps some in the Northern Pacific), are derived, not from any existing continent, but from lands which now exist or have recently existed in the Pacific Ocean. These preliminary observations will enable the reader better to apprehend the importance I attach to the details of physical form or moral charncter, which I shall give in describing the inhabitants of many of the islands.

## CHAPTER II.

## singapore.

## (A sketcl of tify town and island as geen puring sevelal visits HROM 1854 то 1802 .)

FEW places are more interesting to $\mathfrak{a}$ traveller from Europe than the town and island of Singapore, furnishing, as it does, examples of a variety of Eastern races, and of many different religions and modes of life. The government, the garrison, and the chief merchants are English; but the great mass of the population is Chinese, including some of the wealthiest merchants, the agriculturists of the interior, and most of the mechanies and labourers. The native Malays are usually fishermen and boatmen, and they form the main body of the police. The Portuguese of Malncea supply a large number of the clerks and smaller merelants. The Klings of Western India are a numerous body of Mahometans, and, with many Arabs, are petty merchants and shopkeepers. The grooms and washermen are all Bengaiees, and there is a small but
highly respectable class of Parsee merchants. Besides these, there are numbers of Javanese sailors and domestie servants, as well as traders from Celebes, Bali, and many other islands of the Arehipelago. The harhour is crowded with men-of-war and trading vessels of many Europeat mations, and hundreds of Malay praus and Chinese junks, from vessels of several hundred tons burthen down to little fishing boats and passenger sampans; and the town comprises haudsome public buildings and churehes, Mabometan mosques, Hindoo temples, Chinese joss-houses, arood European houses, massive warehouses, queer old Kling and China bazaars, and long suburbs of Chinese and Malay cottages.

By far the most conspicuous of the various kinds of people in Singapore, and those which most attract the stranger's attention, are the Chinese, whose numbers and incessant activity give the place very mith the appearance of a town in China. The Chinese merchant is generally a fat romd-faced man with an important and business-like look. He wears the same style of clothing (loose white smock, and blue or black trousers) as the meanest coolie, but of finer materials, and is always clean and neat; and his long tail tipped with red silk hangs down to his heels. He has a handsome waychouse or shop in town and a goorl house in the country. He keeps a fine horse ame gig, and every evening may be seen taking a drive bareheaded to enjoy the cool breeze. He is rich, he owns several retail shops and trading sohooners, he lends money at high interest and on good security, he makes hard bargains and gets fatter and richer every year.

In the Chinese bazaar are lundreds of small shops in which a miscellameous collection of hardware and dry goods are to lof found, and where many things are sold wonderfully cleap. You may buy gimlets at a penny each, white cotton thread at four balls for a halfuenny, and penknives, corkscrews, munpowder, writing-paper, and many other articles as cheap or cheaper than you can purchase them in England. The shopkeeper is very groodnatured ; he will show you everything he has, and does not seem to mind if you luy nothingr. He bates a little, but not so much as the Klings, who almost always ask
twice what they are willing to take. If you buy a few things of him, he will speak to you afterwards every time you pass his shop, asking you to walk in and sit down, or take a cup of tera, and you wonder how he cau get a living where so many sell the same trilling articles. The tailors sit at a table, not on one; and both they and the shoemakers work well and cheaply. The harbers have plenty to do, shaving hemds and cleming ears; for which latter operation they have a great array of little tweezers, picks, and brushes. In the ontskirts of the town are scores of earpenters and barksmiths. The former seem chiefly to make cothins and highly fanted and decorated clotheshoxes. The latter are montly gmm-makers, and bore the barrels of guns by hand, ont of solid hars of iron. At this tedious operation they may be seen every day, amd they manage to finish of a gun with a dint lock very handsomely. All abont the streets are sellers of water, vegetables, fiuit, soup, and agrragar a jelly made of seaweed), who have many cries as unintelligible as those of London. Others cary a portahle cooking-apparatus on a pole balanced by a table at the other end, and serve up a meal of shell-fish, rice, and vegretables for two or there halfuence; while coolies and boatmen waiting to be hired are everywhere to be met with.

In the interior of the island the Clanese cut down forest trees in the juagle, and saw them up into planks; they cultivate vegetables, which they bring to market; and they grow peprer and gambir, which form important articles of export. The Frenel Jesuits have established missions among these inland Chinese, which seem very successful. I lived for several weeks at a time with the missionary at Bukit-tima, about the centre of the island, where a pretty chureh has been built and there are about 300 converts. While there, I met a missionary who had just arrivel from Tonquin, where he had been living for many years. The Jesuits still do their work thoroughly as of old. In Cochin China, Tonquin, and China, where all Christian teachers are obliged to live in secret, and are liable to persecution, expulsion, anl sometimes denth, every province, even those farthest in the interior, has a permanent desuit mission establishment, constantly kept up by fresh
aspirants, who are taught the languages of the countries they are going to at Penang or Singapore. In Chima there are said to be near a million converts; in Tonquin and Cochin China, more than half a million. One secret of the success of these missions is the rimid economy practised in the expenditure of the funds. A missionary is allowed about 30l, a year, on which he lives in whatever country he may be. This renders it possible to support a darge number of missionaries with very limited means: and the matives, seeing their teachers living in poverty and with none of the luxmies of life, are convinced that they are sincere in what they teach, and have really given up lome and friems and ease and safety, for the good of whers. No wonder they make converts. for it must be a great hlessing to the poor people among whom they labour to have a man anong them to whom they can go in any trouble or distress, who will comfort and advise them, who visits them in siekness, who relieves them in want, and who they see liviug from day to day in dauger of persecution and death entirely for their sakes.

My friend at Bukit-tima was truly a father to his flock. He preached to them in Chinese every Sumay, and had evenings for discussion and conversation on religion during the week. He had a sehool to teach their children. His house was open to them day and night. If a man come to him and said, "I have no rice for my family to eat today," he would give him half of what he had in the house, however little that might be. If another said, "I have no money to pay my debt," he would give him hall the contents of his purse, were it lis last dollar. So, when he was himself in want, he would send to some of the wealthiest among his tlock, and say, "I have no rice in the house," or "I have given away my moner, and am in want of such and such articles." The result was that his Hock trusted and loved him, for they felt sure that he was their true triend, and had no ulterior designs in livity among them.

The island of Singapore consists of a multitude of small hills, three or four hundred feet high, the summits of many of which are still covered with virgin forest. The mission-
house at Pukit-tima was surrounded by several of these wood-topped hills, which were much frequented by woodcutters and sawyers, and offered me an excellent collecting ground for insects. Here and there, too, were tiger pits, carefully covered over with sticks and leaves, and so well concealed, that in several eases I had a marrow escape from falling into them. They are shaped like an iron fumace, wider at the bottom than the top, and are perhaps fifteen or twenty feet deep, so that it would be ilmost impossible for a person unassisted to get out of one. Formerly a sharp stake was stuck erect in the bottom; but after an unfortmate traveller had been killed by falling on onts, its use was forbiden. There are always a few tigers roaming about Singapore, and they kill on an average a Chintman every day, principally those who work in the gambir plantations, which are always made in newlycleared jungle. We heard a tiger roar once or twice in the evening, and it was rather nervous work luuting for insects among the fallen trunks and old sawpits, when one of these savage animals might be lurking close by, waiting an opportunity to spring upon us.

Several hours in the nuiddle of every fine day were spent in these patches of forest, which were delightfully cool and shady by contrast with the bare open country we had to walk orer to reach them. The vegetation was most luxuriant, comprising enormous forest trees, as well as a variety of ferns, calaliums, and other undergrowth, and abundance of climbing rattan palms. Insects were excedingly abundant and very interesting, and every day furnished scores of new and curivas forms. In about two months I obtained no less than 700 species of beetles, a large proportion of which were quite new, and among them were 130 distinct kinds of the elegant Longicoms (Cumbluydie), so much esteemed by collectors. Almost all these were collected in one patch of jungle, not more than a square mile in extent, and in all my subsequent travels in the East I rarcly if ever met with so productive at spot. This exceeding productiveness was due in part no doubt to some favourable conditions in the soil, climate, and vegetation, and to the season being very bright and sumy, with sufficient showers to keep everything freah.

But it was also in a great measure dependent, 1 feel sure, on the labours of the Chinese wood-cutters. They hat been at work here for several years, and during all that time had furnished a contimual supply of dry and dead and decaying leaves and bark, together with abundance of wood and sawdust, for the nourishment of insects and their larve. This had led to the assemblage of a great variety of species in a limited space, and I was the first. naturalist who had come to reap the harvest they hat prepared. In the same place, and during my walks in other directions, I obtained a fuir collection of butterflies and of other orders of insects, so that on the whole I was quite satisfied with these my first attempts tu gain a knowledge of the Natural History of the Malay Archipelago.

## CHAPTER IIL.

## MLALACCA AND MOENT OPHIL.

(JULY TO SETTEMBER, 1854.)

BIRDS and most other kinds of animals being scarce at Singapore, I left it in July for Malaeca, where I spent more than two months in the interior, and made an excursion to Mount Ophir. The old and picturesque town oi Malacea is crowded along the banks of the sumll river, and consists of narrow streets of shops and dwellinghouses, oceupied ly the descendants of the I'ortuguese. and by Chinanen. In the suburbs are the houses of the English officials and of a few I'ortuguese memehants. embedded in groves of palms and fruit-trees, whose varied and beautiful foliage furmishes a pleasing relief to the eyt, as well as most grateful shade.

The old fort, the large Government House, and the ruins of a cathedral, attest the former wealth and importance of this place, which was once as much the centre of Eastern trade as Singapore is now. The following de-
scription of it by Linschott, who wrote two hundted and seventy years ago, strikingly exhibits the change it has undergone:-
"Mracea is inhabited by the Portuguese and by natives of the country, called Malays. The lortuguese have here a fortress, as at Mozambique, and there is no fortress in all the Indies, after those of Mozambique and Ormuz, where the captains perform their duty better than in this one. This phace is the market of all India, of China, of the Moluecas, and of other islands round alout, from all which places, as well as from Banda, Java, Sumatra, Siau, Jera, Bengal, Coromandel, and India, arrive ships, which cone and go incessautly, charged with an infinity of merchaudises. There would be in this place a mach sreater number of Portugnese if it were not for the inomvenience, and unhealthiness of the air, which is hurt ful not only to strangers, hut also to natives of the country. Thence it is that all who live in the country pay tribute of their health, suffering from a certain disease, which makes them lose either their skin or their hair. Ans those who escape consider it a mirack, which aceasions many to leave the comery, while the ardent desire of gain induces others to risk their health, and enteatour to endure such an atmosphere. The origin of this town as the natives say, was very emall, only having at the begimning, by reason of the whenlthiness of the air, but six or seven fishermen who imabited it. Pat the number was increased ly the meeting of fishermen from Sian, Pegu, and lengal, who came and built a city, and estaWished a peculiar langnage, drawn from the most eleram modes of speaking of other nations, so that in fact the language of the Malays is at present the most refinent. exact, and celebrated of all the Fast. The name of Malacea was given to this town, which, by the convenience of its situation, in a short time grew to sucli wealth, that it does not yiell to the most powerful towns and regions round about. The natives, both men aud women, are very courteons, and are reckoned the most skilful in the world in eompliments, and study much to compose and repent verses and love-songs. Their language is in vogue through the Indies, as the French is here."

At present, a vessel over a hundred tons harlly ever enters its port, and the trade is entirely contiued to a few petty products of the forests, and to the fruit, which the trees phated by the old Portuguese now produce for the rajoyment of the inhabitants of Singapore. Although rather sulgect to fevers, it is not at Irusent considered very unhealthy.

The population of Malacea consists of sereral mees. The ubiquitous Chinese are perhaps the most numerous, keeping up their manors, customs, and language; the indigenous Malays are next in point of numbers, and their language is the Libgta-franca of the place Next come the descendants of the lortuguese-a mixed, degraded, and degenerate race, but who still keep up the use of their mother tongue, though ruefully mutilated in grammat; and then there are the English rulers, and the descendants of the Dutch, who all speak Emglish. The Portugnese spoken at Malacea is a useful philological phenomenon. The verbs have mostly lust their intlections, and one form does for all moods, tenses, mumbers, and persons. Eu vai, serves for "I go," "1 went," or, "! will go." Adjectives, too, have been deprived of their feminine and plural terminations, so that the language in reduced to a marvellous simplicity, and, with the abuixture of a few Malay words, becomes mather puzzinge to one who has heard only the pure Lasitanian.

In costume these several peoples are as varied as in their speech. The English preserve the tidht-fitting cunt, waistcoat, and trousers, and the abominable hat and aravat ; the Portuguese patronise a light jacket, or, more frequently, shirt and trousers only; the Malays wear their national jacket and sarong (a kind of kilt), with loose drawers; while the Chinese never depart in the least from their national dress, which, indeed, it is impassible to improve for a tropical elimate, whether as regards comfort or appearance. The loosely-hanging trousers, and neat white half-shirt half-jacket, are exactly what a dress should be in this low latitude.

I engaged two Portuguese to accompany me into the interior; one as a cook, the other to shont and skin birds, which is quite a trade in Malacea. I first stayed a fort-
night at a village called Gading, where I was accommodated in the house of some Chinese converts, to whom I was recommended by the Jesuit missionaries. The house was a mere shed, but it was kept clean, and I made myself sufficiently comfortable. My hosts were forming a pepper and gambir plantation, and in the immediate neighlourhood were extensive tin-washings, employing wer a thousand Chinese. The tin is outained in the fimm of back grains from heds of quartzose sand, and is multed into ingots in rude clay furnaces. The soil seemed forr, and the forest was very dense with undergrowth, and mot at all productive of insects ; but, on the other hand, liirds were abundant, and I was at once introduced to the rich ornithological treasures of the Malayan region.

The very first time I fired my gun I brought down one of the most curious and beautiful of the Malacca birds, the llue-billed gaper (Cymbirhynchus macrorhynchus), called by the Malays the "Rain-bird." It is about the size of a starling, black and rich claret colour with white shoulder stripes, and a very large and brond bill of the most pure cobalt blue above and orange below, while the iris is emerald green. As the skins dry the bill turns dull black, but even then the bird is handsome. When fresh killed, the contrast of the vivid blue with the rich colours of the plumage is remarkably striking and beautiful. The lovely Eastern trogons, with their rich brown backs, beautifully pencilled wings, and crimson breasts, were also soon obtained, as well as the large green barbets (Mergalæma versicolor)-fruit-eating birds, something like small toucans, with a short, straight bristly bill, and whose head and neck are variegated with patches of the most vivid blue and crimson. A day or two after, my hunter brought me a specimen of the green gaper (Calyptomena viridis), which is like a small cock-of-the-rock, but entirely of the most vivid green, delicately marked on the wings with black bars. Handsome woodpeckers and gay kingfishers, green and brown cuckoos with velvety red faces and green beaks, red-breasted doves and metallic honeysuckers, were brought in day after day, and kept me in a continual state of pleasurable excitement. Atter a fortnight one of my servants was seized with fever, and on returning to

Malacen, the same disease attacked the other as well as myself. By a liberal use of quinine, I soon recovered, and obtaining other men, went to stay at the Government busmalow of Ayer-panas, acconipauied by a young gentleman, a mative of the place, who had a taste for matural histors.

At Ayer-panas we hat a comfortable house to stay in, and plenty of room to dry and preserve our specimens: but, owing to there being no industrious Chinese to ent down timber, insects were comparatively scaree, with the exception of butterffics, of which I formed a very fine collection. The manner in which I oltataned one fink insect was curions, and indicates how fragmentary and imperfect a traveller's collection must necessarily be. I was one afternoon walking along a favourite road through the forest, with my gru, when I saw a butterlly on the ground. It was large, handsome, and ruite now to mu, and I got close to it before it flew away. I then observed that it liad been settling on the dung of some earnivorous animal. Thinking it might return to the same spot, I next day after breaktast took my net, and as I approached the place was delighted to see the same butterty sitting on the same piece of dung, and succeeded in capturing it. It was an entirely new species of great beauty, and has been named by Mr. Hewitson Nymphalis calydonia. I never saw auother specimen of it, and it was only after twelve years had elapsed that a second individual reached this country from the northwestern part of Bomeo.

Haviag determincel to visit Mount Ophir, which is situated in the midde of the peninsula about fifiy miles east of Malacea, we engaged six Malays to accompany us and cary our barrare. As we meant to stay at least a week at the momontain, we took with us at goud supply of rice, a little biscuit butter and collee, some dried fish and a little hramly, with blankets, a change of clothes, insect and bird boxes, nets guns and ammunition. The distance from Ayer-panas was sumposed to bo alout thiry miles. Our first day's march lay through patches of forest, clearings, and Malay villages, and was pleasant enourg. At night we slept at the house of a Malay chief, who lent us a verandah, and gave us a fowl aud some
egers. The next day the country got wilher and more hilly. We passed through extensive forests, along paths often up to our knees in mud, and were much annoyed by the leeches for which this district is famms. These little creatures infest the leaves and herbage by the side of the paths, and when a passenger comes along they streteh themselves out at full lenyth, and if they tonch any part of his dress or boly, quit their leaf and athere to it. They then ereep on to his fect, legs, or other part of his boty and suck their fill, the first puncture leing rarely felt Ahting the excitement of walking. On bathing in the froning we generally fomud half a dozen or a dozen on each of us, most frequently on our legs, but sometimes on nur bodies, and I had one who sucked his fill from the side of my neek, hut who luekily missed the jugular vein. There are many species of these forest leeches. All art small, but sone are beantifully mathed with stripes of lright yollow. They probably attach themselves to here ar wher animals which frequent the forest paths, and lave thos nequired the singular hathe of stretehing themselves wht at the sound of a footstep or of rustling foliage. Early in the afternom we reached the fout of the mountain, and encamped by the side of a tine stream, whose rocky banks were overgrown with ferns. Our oldest Malay had been acenstomed to shoot hirls in this neighbourhood for the Malacer dealers, and had been to the top of the mountain, and while we amosed onrselves shooting and insect hunting, he went with two others to clear the path for our ascent the next day.

Early next morning we started after breakfast, carying hankets and provisions, as we intembel to sleep apon the mountain. Niter passing a little tangled jungle aml swampy thickets through which our men had cleared a path, we emerged into a fine lofty forest pretty clear of undergrouth, and in which we could walk frecly. $\mathrm{W}_{\mathrm{t}}$. ascended steadily up at moderate slope for several miles, having a deep ravine on our left. We then had a level platean or shoulder to cross, after which the nscent was steeper and the forest denser till we cane out upon the "Padang-batu," or stone field, a place of which we had heard much, but could never get any one to describe intel-
ligibly. We found it to be a steep slope of even rock, extending along the mountain side farther thau we could sen Parts of it were quite bare, Eut where it was cracked and fissured there grew a most luxuriant vegetation, among which the pitcher plants were the most remarkable. These wonderful plants never seem to succeed well in our hothouses, and are there seen to little advantage. Here they grew lip into half elimbing shrubs, their curous pitchers of various sizes and forms hanging abundantly from their leaves, and continually exciting our admiration by their size and beauty. A few conifere of the genus Dacrydium here first appeared, and in the thickets just above the recky surface we walked through groves of those splendid ferns Dipteris Horsfieldii and Matonia pectinata, which bear large spreading palmate fronds on slender stems six or eight feet high. The Matomia is the tallest and most elegant, and is known only from this mountain, and neither of them

mare ferns on moust ophid. is yet introduced into our hot-houses.

It was very striking to come out from the dark, cool, and
shady furest in which we had been ascending since we started, on to this hot, open rocky slope where we seemed to have entered at one step from a lowland to an alpine vegetation. The height, as measured by a sympiesoneter, was abut 2,800 feet. We had been told we should tim! water at Padang-batu, but we looked about for it in vain, ats we were exceedingly thirsty. At last we turned to the pitcher-plants, but the water contained in the pitchers (about half a pint in each) was full of insects, and otherwise uninviting. On tasting it, however, we found it very palatable though rather warm, and we all quenched our thirst from these natural jurs. Farther on we cane to forest again, but of a more dwarf and stunted chameter than below; and alternately passing along ridges and descending into valleys, we reached a peak separated from the true summit of the mountain by a considerable chasm. Here our porters gave in, and declared they could carry their londs no further; and certainly the ascent to the lighest peak was very precipitous. But on the spot where we were there was no water, whereas it was well known that there was a sping close to the summit, so we determined to go on without them, and carry with us only what was absolutely necessary. We accordingly took a blanket each, and divided our food and other articles among us, and went on with only the old Malay and his son.

After descending into the saddle between the two peaks we found the ascent very laborious, the slope being so steep as often to necessitate hand-climbing. Besides a bushy vegetation the ground was covered knee-deep with mosses on a foundation of decaying leaves and rugged rock, and it was a hard hour's climb to the small ledge just below the summit, where an overhanging rock forms a convenient shelter, and a little basin collects the trickling water. Here we put down our louds, and in a few minutes more stood on the summit of Mount Ophir, 4,000 feet above the sen. The top is a small rocky platform covered with rhododendrons and other shrubs. The afternoon was clear, and the view fine in its way-ranges of hill and valley everywhere covered with interminable forest, with glistening rivers winding among them. In a distant view a forest country is very monotonous, and nu
mountain I have ever ascended in the tropics presents is panorana equal to that from Snowton, while the views in Switzerland are immeasurably superiop. When boiling our coffee I took olservations with a good boilins-point thermometer, as weil as with the sympiesometer, and we then enjoyed our evening meal and the noble prospect that lay before us. The night was calm and very mild, and having made a bed of twigs and branches over which we faid our blankets, we passed a very comfortable night. Our porters laul fillowed us after a rest, briaging only theit rice to cook, and hockily we did not require tho baygage ihey left behind them. In the morning I caught a dow butter flies and leetles, and my friend got a few land-shells; and we then descented, bringing with us some specimens of the ferns and pitcher-plants of Padang-batu.

The place whre we had first eneamped at the foot of the mountain leing very gloomy, we chose another in a kind of owamp near a stream overgrown with Ziugiberaceous plants, in which a clearing was easily made. Here our men built two little huts without sides, that would just shelter us from the rain; and we lived in them for a week, shooting and insect-hunting, and roaming about the forests at the foot of the mountain. This was the country of the great Argus $\mathrm{l}^{\text {heasant, }}$ and we continually heard its cry. On asking the old Malay to try and shoot one for me, he told me that although he had been for tweuty years shoot ing hirds in these forests he had never yet shot one, and had never even seen one except after it had becu caught. The hird is so exceedingly sly and wary, and runs along the ground in the densest parts of the forest so quickly, that it is impossible to get near it ; and its saber colours and rich eve-like spots, which are so omamental when seen ins it museum, must harmonize well with the dead leaves amony which it dwells, and render it very inconspicnous. All the specimens sold in Malacea are caught in snares, and my informant, though he had shot noue, had snared plenty.
The tiger and rhinoceros are still found here, and a few years ago elephants abounded, but they have lately all disappeared. We found some heaps of dung, which seewed to be that of elephants, and some tracks of the
rhinoceros, but saw none of the animals. We, however, kept a fire up all night in case any of these creatures should visit us, and two of our men declared that they did one day see a rhinoceros. When our rice was finished, and our boxes full of specimens, we returned to Ayer-Pauas, and a few days afterwards went on to Malacea, and thence to Singapore. Mount Ophir has quite a reputation for fever, and all our friends were astonished at our recklessness in staying so long at its foot; but we none of us suffered in the least, and I shall ever look back with pleasure to my trip, as being my first introduction to mountain scenery in the Eastern tropics.

The meagreness and brevity of the sketch I have here given of my visit to Singapore and the Malay leuinsula is due to my having trusted chiefly to some private letters and a note-book, which were lost; and to a paper on Malacea and Monnt Ophir which was sent to the Royai Geographical Society, but which was neither read nor printed owing to press of matter at the end of a session, and the MSS, of which cannot now be fonnd. I the less reyret this, however, as so many works have been written on these parts; and I always intended to pass lightly over my travels in the western and better known portions of the Archipelago, in order to devote more space to the remoter districts, about which lavelly anyding has been written in the English language.

## CHAP'LER IV.

## BORNEO—THL ORAXG-UTAN.

IARRIVED at Sariwak on November 1st, 1854, and left it on January $25 \mathrm{th}, 1850$. In the interval I resided at many different localities, and saw a good deal of the Dyak tribes as well as of the Bornean Malays. I was hospitably entertained by Sir James Brooke, and lived in his house whenever I was at the town of Sarawak in the
intervals of my journeys. Put so many books lave been written about this part of Borneo since I was there, that I shall avoid going into details of what I saw and heard and thought of Sariwak aud its ruler, confining myself chiefly to my experiences as a naturalist in search of shells insects birds and the Orang-utan, and to an account of a journey through a part of the interior seldom visited by Europeans.

The first four months of my visit were spent in varions parts of the sariwak River, from santubong at its mouth up to the picturesque limestone Monntains and Chinese gold-fields of Bow and Bede. This part of the country has been so frequently described that I shall pass it over, especially as, owing to its being the height of the wet season, my collections were compratively poor and insitgnificant.

In Mareh 18 a5 1 determined to go to the coal-works which were being opened near the Simungon liver, at small branch of the Sadong, a river east of Sariwak and between it and the Batang-Lupar. The Simunjon enters the Sadong River about twenty miles up. It is very narrow and very winding and much overshadowed by the lofty forest, which sometimes almost meets over it. The whole country between it and the sea is a perfectly level forest-covered swamp, out of which rise a few isolated hills, at the foot of one of which the works are situated. From the landing-place to the hill a Dyak road had been formed, which consisted solely of tree-trunks laid end to end. Along these the bare-footed natives walk and carry heary burdens with the greatest ease, but to a booted European it is very slippery work, and when oue's attention is constantly attracted by the various oljects of interest around, is few tumbles into the bog are almost inevitalle. During my first walk along this road I saw few insects or birds, but noticed some very handsome orchids in flower, of the genus Celogyne, a group which I afterwards found to be very abuodant, and characteristic of the district. On the slope of the hill near its foot a patch of forest had been cleared away, and several rude houses erected, in which were residing Mr. Coulson the engineer, and a number of Chinese workmen. I was at
first kindly accommodated in Mr. Coulsou's house, lut linding the spot very sutatale for me and offering great facilities for collecting, I had a small house of two rooms and a verandah built for myself. Here I remained nearly nine months, and made an inmense collection of insects, to which class of animals I devoted my chicf attention, owing to the circumstances being especially favourable.

In the tropics a large proprotion of the insects of all unders, and especially of the large and favourite group of beetles, are more or less dependent on vegetation, and particularly on timber, bark, and leaves in various stages of decay. In the untouched virgin forest, the inseets which frequent such situations are scattered over an immense extent of country, at spots where trees lave fullen through decay and old age, or have succumbed to the fury of the tempest; and twenty square miles of country may not contain so many fallen and decayed trees as are to he found in any small clearing. The quantity and the variety of beetles and of many other insects that can be collected at a given time in any tropical locality, will depend, first upon the immediate vicinity of a great extent of virgin forest, and secondly upon the quantity of trees that for some months mast have been, and which are still being cut down, and left to dry and decay upon the ground. Now, during my whole twelve years' collecting in the western and eastern tropies, I never enjoyed such advantages in this respect as at the Simunjon coal-works. For several months from twenty to fifty Chinamen and Dyaks were employed almust exclusively in clearing a large space in the forest, and in making a wide opening for a railroad to the Sadong River, two miles distant. Besides this, sawpits were established at various points in the jungle, and large trees were felled to be cut up into beams and planks. For hundreds of miles in every direction a magnificent forest extended over phain and mountain, rock and morass, and I arrived at the spot just as the rains began to diminish and the daily sunshine to increase; a time which I have always found the most favourable season for collecting. The number of openings and sunny places and of pathways, were also an attraction to wasps and butterflies; and by paying a cent each for all insects

that were brought me, I obtained from the Dyaks aluel the Chinamen many fine locusts aud Phasmidm, as well as numbers of handsome bectles.

When I arrived at the mines, on the 14 th of Mareh, I had collected in the four preceding months, 320 different kinds of beetles. In less than a fortnight I had doubled this number, an average of about 24 new species every day. On one day I collected 76 different kinds, of which $3 t$ were now to me. By the end of April I had more than a thousand species, and they then went on increasing at a slower rate; so that I obtained altogether in Borneo about two thousand distinet kinds, of which all but about a hundred were collected at this place, and on scarcely more than a square mile of ground. The most numerous and most interesting groups of beetles were the Longicoris and Rhynchophora, both pre-eminently wood-feeders. The former, characterised by their graceful forms and lons antenne, were especially numerous, nmounting to nearly three humdred species, nine-tenths of which were entirely new, and many of then remarkable for their large size, strange forms, and beautiful colouring. The latter correspond to our weevils and allied groups, and in the tropics are exceedingly numerous and varied, often swarming upon dead timber, so that I sometimes obtained filty or sixty different kinds in a day. My Bornean collections of this, group exceeded five hundred species.

My collection of butterflies was not large; but I obtained some rare and very handsome insects, the most remarkable being the Ornithoptera Brookeana, one of the most elegant species known. 'This beatiful creature has very long and pointed wings, almost resembling a sphinx moth in shape. It is deep velvety black, with a curved band of spots of ib brilliant metallic-rreen colour extending across the wings from tip to tip, each spot being shaped exactly like a small triangular feather, and having very much the effect of a row of the wing coverts of the Mexican trogon laid upon black velvet. The only other marks are a broad neekcollar of vivid crimson, and a few delicate white touches on the outer margins of the hind wings. This species, which was then duite new and which I named after Sir tames Brooke, was very rare. It was seen occasionally flying
swifly in the elearings, and now and then setting for an instant at puddes and mulely places, so that I only succeeded in capturing two ur three siecimens. $I_{13}$ sume ofloer parts of the country I was assmred it was abondant, and a good many specimens have been sent to Thgland; but as yet all have been mates, and we are guite tuable to conjecture what the female may be like, owing to the extreme isolation of the species, and its want of close aflinity to any other known insect.

One of the most cmious and interesting reptiles whic $l_{\text {, }}$ I net with in lomeo was a large tree-fing, which was

brought me ly une of the Chmese worknem. If. assured me that he had secu it come down, in a slanting direction, from a hightree, as if it flew. On examining it, I found
the toes very long and fully webbed to their very extremity, so that when expanded they offered at surface much larger than the boily. The fure legs were also bordered by a membrane, and the body was capable of considerable intlation. The back and limbs were of a wery deep shining preen colour, the under surface and the inner toes yellow, while the wels were black, rayed with yellow. The body was about four inches long, while the welos of each hind foot, when fully expanded, covered a surface of four square inches, and the webs of all the feet torether alnout twelve square inches. As the extremities of the toes lave dilated dises for allhesion, showing the creature to be a true treefrog, it is dithents to inagime that this immense membrane of the toes can be for the purpose of swimming ouly, and the aceount of the Chinaman, hat it flew down from the tren Ineomes more credible. This is, I beliese, the first instanere known of a "dying frog," and it is very intoresting to Darwinians as showing, that the woriality of the toes Which have heen already modified for gurposes of swinming and athesive chimbing, lave been taken advantage of tor enable an allied species to pass through the air like the flying lizard. It wouhd mppear to bee athew specias of the trenms Finacophorus, whinh consists of screat fioms of a wach smaller size than this, and baving the wobs of the toes less developed.

Juring hy stay in Bornen I hat ha liunter (o) shont for me regulaty, and, being myself fully oceupied with insects, I did unt suceend in obtaning a very enot collection of the himes or Minmmalia, many of which, however. are well linown, being identioal with species found in Malacea. Among the Manmadia were five spuimels, two tiger-cats, the Gynmums Rambesii, which looks like a cross betweot a pig and a prolecat, and the Cynomale Demetti-a sawe, utter-like athmal, with very hroad muzale clothed with loug histles.

One of myy chaf obirets in enming to stay at Ximungom was to see the Cram-utan (or great man-like ape of Borneos) in his mative lumms, to study his lalits, amd ohtain good specimens of the different rarieties and speches of both sexes, and of the adult and young animats. In all these abjects I sureveth luyom mix expectations, amd will now

utan, or "Mias," as it is called by the natives; and as this name is short, and easily promounced, I shall generally usa it in preference to Simia satyrus, or Oraug-utan.

Just a week after my arrival at the mines, I first saw a Mias. I was out collecting iusects, not more than a puarter of a mile from the house, when 1 heard a rustling in a tree near, and, looking up, saw a large red-haired animal moving slowly along, haging from the branches by its arms. It passed on from tree to tree till it was lost in the jungle, which was so swampy that I could not follow it. This mode of progression was, however, very unusual, and is more characteristic of the Hylobates than of the Orang. I suppose there was some individual peculiarity in this animal, or the nature of the trees just in this place rendered it the most easy mode of progression.

About a fortnight afterwards I heard that one was feeding in a tree in the swamp just below the house, and, taking my gum, was fortunate enough to find it in the same place. As soon as I approached, it tried to enneral itself among the foliage; but I got a slout at it, and the secont barrel caused it to fall down almost dead, the two balls having entered the body. This was a male, about halfgrown, being searecly three feet high. On April 26th, I was out shooting with two Dyaks, when we found another about the same size. It fell at the first shot, but did not seem much hurt, and immediately climbed up the nearest, ree, when I fired, and it again fell, with a broken arm and a wound in the body. The two Dyaks now ran up to it, and each seized hold of a hand, telling me to cut a pole, and they would secure it. But although one arm was broken and it was only a half-grown amimal, it was too strong for these young savages, drawing them up towards its mouth notwithstanding all their cllorts, so that they were again obliged to leave go, or they would have been seriously bitten. It now began climbing up the tree again; and, to avoid trouble, I shot it through the heart.

On May 2ll, I again tound one on a very high tree, when I had only a small 80 -bore gun with me. However, I fired at it, and on seeing me it began howling in a strange voice like a congh, and seemed in a great rage, breaking of branches with its hands and throwing them down, and
then soon matle off over the tree-tops. I did not care to follow it, as it was swampy, and in parts dangerous, and I might easily have lost nyself in the eagerness of pursuit.

On the 12ths of May I found another, which behaved in a very similar manner, howling and hooting with rage, and throwing down brancles. I shot at it five times, and it remaned dead on the top of the tree, supported in a fork in such a manner that it wouk evidently not fall. I therefore returned home, and luckily foum some Dyaks, who same back with mo, and climbed up the tree for the animal. This was the first full-grown specimen I had obtained; but

it was a female, and not nearly so large or remarkable as the finll-grown males. It was, however, 3 ft .6 in . high, and its arms stretched out to a width of $\mathrm{f}^{\circ} \mathrm{ft} .6 \mathrm{in}$. I preserved the skin of this specimen in a cask of arrack, and prepared a perfect skeleton, which was afterwards purchased for the Derby Museum.

Only four days afterwards some Dyaks saw another Mias near the same place, and came to tell me. We found
it to be a rather large one, very high up on a tall tree. At the second shot it fell rolling over, but almost immediately grot up again and began to climb. At a third sloot it fell dead. This was also a full-grown female, and while preparing to carry it home, we found a young one face downwards in the bog. This little creature was only about a foot long, and hod evidently been hanging to its mother when she first fell. Luckily it did not appear to have been wounded, and after we had cleaned the mud out of its mouth it began to cry out, and seemed quite strong and active. While carrying it home it got its hands in my lreard, and grasped so tightly that I had great dilticulty in retting free, for the fingers are habitually bent inwards at the last joint so is to form complete hooks. At this time it had not a single tooth, but a few days afterwards it cut its two lower front teeth. Unfortunately, I had no milk to give it, as neither Malays Chinese nor Dyaks ever use the article, and I in vain inquired for any female aninal that eould suckle my little intant. I was therefore obliged to give it rice-water from a bottle with a quill in the work, which after a few trials it learned to suck very well. This was very mengre diet, and the little creature did not thrive well on it, although I added sugar and cocoa-nut milk occasionally, to make it more nomishing. When I put my finger in its mouth it sucked with great vigour, drawing in its cheels with all its might in the vain effort to extract some milk, and only after jersuvering a long time wond it give up in disgust, and set up a scream very like that of a baby in similas circumstances.

When handled or nursed, it was very quict and contented, but when laid down by itself wonh invariably ery; and for the first few nights was very restless mad noisy. I fitted up a little box for a cradle, with a soft mat for it to lie unon, which was changed and washed every day; and 1 soon found it neeessary to wash the little Mias as well. After I had done so a lew times, it came to like the "peration, and as soon as it was dirty would begin crying, and not leave off till I took it ont and carried it to the spont, whon it immediately beame quiet, allhough it woull wince a little at the first rush of the cold water
and make ridiculonsly wry faces while the stream was running over its head. It enjoyed the wiping and rubbing dry amazingly, and when I brushed its hair seemed to be perlectly happy, lying quite still with its arms and legs stretched out while I thoroughly brushed the long hair of its back and arms. For the first few days it clung desperately with all four hands to whatever it could lay hohl of, and I had to be careful to keep my beard out of its way, as its fingers clutched hold of hair more tenaciously than anything else, and it was impossible to free myself without assistance. When restless, it would struggle abont with its lands up in the air trying to find something to take hold of, and, when it had got a bit of stick or rag in two or three of its hands, seemed quite happy. For want of something else, it would often seize its own feet, and after a time it would constantly cross its arms and grasp with rach hand the long hair that grew just below the opposite shoulder. The great tenacity of its grasp soon diminished, and I was obliged to invent some means to give it exercise and strengthen its limbs. For this purpose I made a shont ladder of three or four rounds, on which I put it to hans for a quarter of an hour at a time. At first it seemed much pleasen, but it could not get all four hands in a comfortable prosition, and, after changing about several limes, would leave hold of one hand after the other, and frop on to the floor. Sometimes when haning only by two hands, it would loose one, and cross it to the opposite shoulder, grasping its own hair; and, as this seemed much more agrecable than the stick, it would then loose the wher and tumble down, when it would eross both and lie (1) its back quite contentedly, never seeming to be hurt. liy its numerous tumbles. Finding it so fond of hair, I rindeavoured to make an artificial mother, by wrapping up a piece of buflalo-skin into a bundle, and suspemeling it about a foot from the floor. At first this seemed to suit it admirally, as it could sprawl its legs about and always find sonve hair, which it grasped with the greatest tenacity. I was now in hopes that I had made the little orphan quite happy ; and so it seemed for some time, till it began to remember its Iost parent, and try to suck. It would poll itself up elose to the skin, and try ahout everywhere
for a likely place; lut, as it only succeeded in getting mouthfuls of hair and wool, it would be greatly disgusted, and scream violently, and, after two or three attempts, let go altogether. One day it got some wool into its throat, and I thought it would have choked, but after much gasping it recovered, and I was obliged to take the iutation mother to pieces again, and give up this last attempt to exercise the little creature.

Aiter the first week I found I could feed it better with a spoon, and give it a little more varied and more solid food. Well-soaked biscuit mixed with a little eqg and sugar, and sometimes sweet potatocs, were readily eaten; and it was a never-failing amusement to observe the curious changes of countenance by which it would express its approval or dislike of what was given to it. The poor little thing would liek its lips, draw in its cheeks, and turn up its eyes with an expression of the most supreme satisfaction when it had a mouthful particularly to its taste. On the other hand, when its food was not sufficiently sweet or palatable, it would turn the mouthful about with its tomgue for at moment as if trying to extract what davour there was, and then push it all out hetween its lips. If the same food was continued, it would set up a screan and kick about riolently, exactly like a baby in a passion.

After I had had the little Mias about three weeks, I fortunately obtained a young hare-lip monkey (Macacus cynomolgnsi, which, though small, was very active, and could feed itself. I placed it in the same box with the Mias, and they immediately became excellent friends, neither exhihiting the least fear of the other. The little monkey would sit upon the other's stomach, or even on its face, without the least regard to its feelings. While I was feeding the Mias, the monkey would sit Ly, picking up all that was spilt, and oceasionally putting out its hands to intercept the spoon; and as soon as I had finished would pick all what was left sticking to the Mias' lips, and then pull open its mouth and see if any still remained inside; afterwards lying down on the poor creature's stomach as on a comfortable cushion. The little belpless Mias would submit to all these insults with the most
exemplary patience, only too glad to have something warm near it, which it could clasp affectionately in its arms. It sometimes, however, had its revenge; for when the monkey wanted to go away, the Mias would hold on as long as it could by the loose skin of its back or head, or by its tail, and it was only after many vigorous jumps that the monkey could make his escape.

It was curious to observe the different actions of these two animals, which could not lave differed much in age. The Nias, like a very young baby, lying on its back quite helpless, rolling lazily from side to side, stretching out all four hands into the air, wishing to grasp something, but. hardly able to guide its fingers to any definite object; and when dissatisfied, opening wite its almost toothless month, and expressing its wants by a most infantine scream. The little monkey, on the other hand, in constant motion; running and jumping about wherever it pleased, examining everything around it, seizing hold of the smallest objects with the greatest precision, balancing itself on the edge: of the box or rumning up a post, and helping itself to auything eatable that came in its way. There could hardly he a greater contrast, and the baby Mias looked more baby-like by the comparison.

When I had had it about a month, it began to exhibit some signs of learning to run alone. When laid upon the floor it would push itself along by its legs, or roll itself ower, and thus make an unwieldy progression. When lying in the box it would lift itself up to the edge into ahmost an erect position, and once or twice succeeded in tumbling out. When left dirty, or hungry, or otherwise neglected, it would scream violently till attended to, varied by a kind of coughing or pumping noise, very similar to that which is made by the adult anmal. If no one wats in the house, or its cries were not attonded to, it would be quiet after a little while, bat the moment it heard a footstep would bergin again harder than ever.

After five weeks it cut its two upper front teeth, but in all this time it had not grown the least bit, remaining both in size and weight the same as when I first procured it. This was no doubt owing to the want of milk or other equally nourishing foot. Rice-water, rice, and biscaits
were but a poor substitute, and the expressed milk of the cocoa-nut which I sometimes gave it did not quite agree with its stomach. To this I imputed an attack of diarrhera from which the poor little creature suffered greatly, but a small dose of castor-oil operated well, and cured it. A week or two afterwards it was again taken ill, and this time more seriously. The symptoms were exactly those of intermittent fever, accompanied by watery swellings on the feet and head. It lost all appetite for its food, and, after lingering for a week a most pitiable olject, diel. aiter being in my possession nearly three months. I mueh regretted the loss of my little pet, which I had at one time looked forward to bringing up to years of maturity, and taking home to England. For several months it had afforded me daily amusement by its curious ways and the inimitably ludicrous expression of its little countenance. Its weight was three pounds nine ounces, its height fourteen inches, and the spread of its arms twenty-three inches. I preserved its skin and skeleton, and in doing so found that when it fell from the tree it must have broken an arm and a leg, which had, however, united so rapidly that I lad only noticed the hard swellings on the limbs where the irregular junction of the bones had taken place.

Exactly a week after I had caught this interesting little animal I succeeded in shooting a full-grown male Orangutan. I had just come home from an entomologisiug excursion when Charles ${ }^{1}$ rushed in out of breath with ruming and excitement, and exclaimed, interrupted by gasps, " Get the gun, sir,-be quiek, - such a large Mias!" "Where is it?" I asked, taking hold of my gun as I spoke, which happencd luckily to have one barre! loaded with ball. "Close by, sir-on the path to the mines-he can't get away." Two Dyaks chanced to be in the house at the time, so I called them to accompany me, and started off, telling Charley to bring all the ammunition after me as soon as possible. The path from our clearing to the mines led along the side of the hill a little way up its slope, and parallel with it at the foot a wide opening had been made for

[^2]a road, in which several Clinamen were working, so that the animal could not escape into the swampy forest below without descending to cross the road or aseending to get round the clearings. We walked cautiously along, not making the least noise, and listening attentively for any sound which might betray the presence of the Mias. stopping at intervals to gaze upwards. Charley som fomed us at the place where he had seen the crature, and having taken the nmmunition and put a bullet in the other barrel we dispersed a little, feeling sure that it must be somewhere near, as it had probably descended the lill, and would not be likely to retum again. After a shont time I heard a very slight rustling sound overhead, but ou gazing up conld see nothing. I moved about in every direction to get a full view into every part of the tree under which $\tilde{I}$ had been standing, when I again heard the same noise but louder, and saw the leaves shaking as if caused by the motion of some heavy animal which moved off to an adjoining tree. I immediately shouted for all of them to come up and try and get a view, so as to allow me to have a shot. This was not an easy matter, as the Mias had a knack of selecting places with dense foliage beneath. Very soon, however, one of the Dyaks called me and pointed upwards, and on looking I saw a great red hairy body and a huge black face gazing down from a great height, as if wanting to know what was making such a disturbance below. I instantly fired, and he made off at once, so that I could not then tell whether I had hit him.

He now moved very rapidly and very noiselessly for so large an animal, so I told the Dyaks to follow and keep him in sight while I loaded. The junule was here full of large angular fragments of rock from the monntain above, and thick with hanging and twisted creepers. Punning, climbing, and creeping among these, we came up with the creature on the top of a high tree near the road, where the Chinamen had discovered him, and were shouting their astonishment with open mouth: "Ya Ya, Tuan; Orangutan, Tuan." Secing that he could not pass here without descending, he turned up again towards the hill, and I got two shots, and following quickly had two more by the time he had again reached the path; but he was always
more or less concealed by foliage, and protected by the large branch on which he was walking. Once while loading I had a splendid view of him, moving along a large limb of a tree in a semi-erect posture, and showing him to he an animal of the largest size. At the path lue got on to one of the loftiest trees in the forest, and we could see one leg hanging down useless, having been broken by a i iall. He now fixed himself in a fork, where he was hidden by thick foliage, and seemerl disinclined to move. I was afraid he would remain and die in this position, and as it was nearly evening I could not have got the tree cut down that day. I therefore fired again, and he then moved ofl, and groing up the hill was obliged to get on to some lower trees, on the latuches of one of which he fixed himself in such a position that he conh not fall, and lay all in a heap as if dead, or dying.

I now wanted the Dyales to go up and cut off the branch he was resting on, but they were afraid, saying he was not dead, and would come and attack them. We then shook the adjoining tree, pulled the hanging ereepers, and did all we conld to disturb him, but without effect, so I thonght it hest to send for two Chinamen with axes to cut dowa the tree. While the messenger was gone, however, one of the Dyaks took comrage and climbed towards lim, but the Mias did not wait for him to get near, moving off to another tree, where lie got on to a dense mass of branches and creepers which almost completely hid him from our view. The tree was luckily a small one, so when the axes came we soon had it cut though; but it was so held up by jungle ropes and climbers to adjoining trees that it only fell into a sloping position. The Mias did not move, and I began to fear that after all we should not get him, as it was near evening, and half a dozen more trees would have to be cut down before the one he was on wouhd fall. As a last resource we all began pulling at the creepers, which shook the tree very much, and, after a few minutes, when we had almost given up all hopes, down he came with a crasla and a thud like the fall of a giant. And he was a giant, his head and body being full as large as a man's. He was of the kind called by the Dyaks "Mias Chappan," or "Mins Pappan," which has the skin of the face broadened out
to a ridge or fold at each side. Mis outstretched arms measured seven feet three imehes acrose, and his height, measuring finly from the top of the head to the heel, was four feet two inches. The hody just below the arms was three feet two inches round, and was quite as long as a man's, the leos heing exceedingly short in proportion. On examination we found he had buen dreadfully womded. Ioth legs were broken, one hipjoint and the root of the spine completely shattered, and two bullets were found fattened in his neek and jaws! Yet he was still alive when he fell. The two Chinamen carried him home tied to a pole, and I was oceupied wath Charley the whole of the next diy, preparing the skin and boiling the bones to make a perlect skeleton, which are now preserved in the Museum at Derby.

About ten days alter this, on June 4th, some Dyaks came to toll us that the day before a Mias had nearly lilled one of their companions. A few miles down the river there is a Dyal house, and the imhabitants saw a large Orang feeding on the young shoots of a palm by the river-side. On lecing alamed he retreated towards the jungle which was cluse by, and a number of the men, frmed with spears and chappers, ran out to intercept him. The man who was in front tried to rum his suear through the animal's boty, hat the Mas seiged it in his hands, and in an instant got hold of the man's arm, which he seized in his month, making his tecth mect in the flesh above the elbow, which he tore and lacerated in a dreadhul manner. Had not the others lien close behind, the man would have been more sorionsly ingured, if not killed, as he was quite powerless: but they soon destroyed the creature with their spears and choppers. The man remained ill for a long time, and never fully reenered the use of his arm.

They told me the duad Mias was still lying where it hat been killed, so 1 ofiered them a seward to bring it up to our landing-place immediately, which they promised to do. They did not come, however, till the next day, and then decomposition hat commenced, and great patches of the lair came oft, so that it was useless to skin it. This I regretted much, as it was a very tine full-grown male. I cut off the head and took it home to clean, while I got
my men to make a close fence about five feet high round the rest of the body, which would soon be devoured by maggots, small lizards, and ants, leaving me the skeleton. There was a great gash in his face, which had cut deep into the bone, but the skull was a very fine one, and the teeth remarkably large and perfect.

On Tune 18th I had another great success, and obtained a fine adult male. A Chinaman told me he had seen him feeding ly the side of the path to the river, mad I found him at the same place as the first individual I had shot. He was feeding on an oval green fruit having a fine red arillus, like the mace which surrounds the nutmeg, and which alone he seemed to eat, biting off the thick outer rind and dropping it in a continual shower. I had found the same fruit in the stomach of some others which I had killed. Two shots eaused this animal to loose his hokd, but he lung for a considerable time by one land, and then fell fat on his face and was half buried in the swamp. For several minutes he lay groaning and panting, while we stood close round, expecting every breath to be his last. Suddenly, however, by a violent effort he raised himself up, causing us all to shep back a yard or two, when, standing nearly ereet, he canght hold of a small tree, and began to ascend it. Auother shot through the back caused him to fall down deal. A thattened bullet was found in his tongre, having entered the lower part of the abdomen and completely traversed the horly, fracturing the first cervienl vertebra. Yet it was after this fearful wound that he had risen, and begun clinbing with considerable faciity. This also was a full-grown made of almost exactly the same dimensions as the other two I had measured.

On June "2lst I shot another adult female, which was cating fruit in a low tree, and was the only one which I ever killed by a single ball.

On Jme $24 t h$ I was calleal by a Chinaman to shoot a Mias, which, he said, was on a tree close by his house, at the coal-mines. Amiving at the place, we had some difticulty in diwling the animal, as he had gone off into the jungle, which was very rocky and diflicult to traverse. At last we found him up a very high tree, and could see that he was a male of the largest size. As soon as I had
fired, he moved higher up the tree, and while he was doing so I fired again; and we then saw that one arm was broken. He lad now reached the very highest part of an immense tree, and immediately began breaking off boughs all around, and laying them across and across to make a nest. It was very interesting to see how well he had chosen his place, and how rapidly he stretched out his unwounded arm in every direction, breaking off goodsized boughs with the greatest ease, and laying them back across each other, so that in a few minutes he had formed a compact mass of folinge, which entirely concealed him from our sight. He was evidently going to pass the night here, and would probably get away early the next moming, if not wounded too severely. I therefore fired again several times, in hopes of making him leave his nest ; but, though I felt sure I had hit him, as at each shot he moved a little, he would not go away. At length he raised himself up, so that half his body was visible, and then gratuatly sank down, his head alone romaining on the elige of the nest. I now felt sure he was dead, and tried to persuade the Clinaman and his companion to cut down the tree; but it was a very large one, and they lad been at work all day, and nothing would induce them te attempt it. The next morning at daybreak, I came to the place, and fomm that the Mias was evidently dead, as his head was visible in exactly the same position as before. I now offered four Chinamen a day's wayes each to cut the tree down at once, as a few hours of sunshine would cause decomposition on the surface of the skin; but, after looking at it and trying it, they determined that it was very big and very hard, and wonld not attempt it. Hud I dowbled my offer, they would probably have accepted it, as it would not have been more than two or three hours' work; and had I been on a short visit only I would have done so; but as I was a resident, and intended remaining several months longer, it would not have answered to begin paying too exorbitantly, or I should have got nothing done in future at a lower rate.

For some weeks after, a clond of flies could be seen all day, hovering over the body of the dead Mias; but in about a month all was quiet, and the body was evidently
drying up under the influence of a vertical sun alternating with tropieal rains. Two or three months later two Malays, on the ofter of a dollar, climbed the trees, and let fown the dried remains. The skin was ahost entire, enclosing the skeleton, and inside were millions of the pupa-cases of thes and other inserts, with thousamels of two or three species of small neerophacons beetles. The skull had been much shattered by balls, but the skeleton was perfect, except one small wist-bonc, whieh had probably dropped out and been carried away by a lizard.

Three days after I had shot this one and lost it, Charles found three small Orags feeting together. Wo had a long chase after them, and had it good opportunity of seemg how they make thoir way from tree to tree, by always choosing those limbs whose branches are intermingled with those of some other tree, and then grasping several of the small twigs together before they venture to swing themselves across. Yet they do this so quickly and certainly, that they make way among the trees at the rate of full five or six miles an hour, ats we lited continually to run to keep un with them. One of these we shot and killed, but it remaned high up in the fork of a tree; and, as yourg animals are of comparatively litte interest, I did not have the tree cut down to get it.

At this time I had the mistortune to slip among some fallen trees, and hurt my ankle, and, not being careful emongh at lisst, it became a severe inflaned ulcer, which would not heal, and kept ne a prisoner in the house the whole of July and part of August. When I coukd get out again, I determined to take a trip up a btanch of the simutujon River to Semabang, where there was said to be a large Dyak house, a mountain with abundance of fruit, and plenty of Omages and tine birds. As the river was very narrow, and I was obliged to go in a very small loat with little luggage, I only took with me a Chinese boy as a servant, I carried at cask of medicated arrack to put Mias skins in, and stores and ammuntion for a fortught. After a few miles, the stram became very marow and winding, and the whole conntry on each side was tlooded. On the banks were abumbane of monkeys,-the comoon Macacus cynomolgus, a blick Semonithecus, and the
extraordinary long-nosed monkey (Nasalis larvatus), which is as large as a threc-year old child, has a very long tail. and a fleshy nose, longer than that of the liggest-nosed man. The further we went on the narrower and more winding the stream became; fallen trees sometimes blocked up our passage, and sometimes tangled branches and creepers met completely across it, and had to bro cut away before we could get on. It took us two days to reach Somilams, and we hardly saw a bit of dry lamd all the way. In the latter part of the foumey I could touch the hushes on each side for miles; and we were often delayed by the screw- ]ines (Pandanus), which arew abundantly in the water, falling across the stream. In other places dense rafts of floating grass completely filled up the channel, making ow journey a constant succession of difliculties.

Near the landing-place we found a fine louse, 250 feet Jong, raised ligh above the groum on posts, with a wide verandah and still wider platform of bamber in front of it. Almost all the people, however, were away on some excursion after elible Lirds'-nests or bees'-wax, and there only remained in the house two or three old men and women with a lot of children. The mountain or hill was close by, covered with a complete forest of fruit-trees, among which the Dumban and Mangusteen were very abundant; but the finit was not yot quite ripe, except a little here aud there. I spent a weok at this phace, going out every day in various directions about the mountain, acempanied loy a Malay, who hat stayed with me white the othor boamen retumen. For three days we foumd no Orags, but shot a deer and several monkeys. On the form day, however, we foum a Mias feeding on a very dofty $\mathrm{J}_{\mathrm{urian}}$ tree, and succeeded in killing it, after eight shots. Unfortumately it remaned in the tree, hanging by its lands, and we were ohliged to leave it and return home, as it was several miles off. As I felt pretty sure it would fall during the night, I retumed to the place early the next morning, and found it on the gromed beneath the tree. To my astonishment and pleasure, it appeared to be a different kind from any I had yet seen for although a full-grown male by its fully developed teeth and very
large canines, it had no sign of the lateral protuberance on the face, and was about one-tenth smaller in all its dimensions than the other adult males. The upper incisors, however, appeared to be broader than in the larger species, a charater distinguishing the Simia morio of Professor Owen, which he had described from the cranium of a female specimen. As it was too far to carry the animal home, I set to work and skinned the body on the spot, leaving the head hands and feet attached, to be finished at home. This specimen is now in the British Museum.

At the end of a week, finding no more Orangs, I returned home; and, taking in a few fresh stores, and this time accompanied by Charles, went up another brauch of the river, very similar in chameter, to a place called Menyille, where there were several small Dyak houses and one large one. Here the landing-place was a bridge of rickety poles, over a considerable distance of water; and I thought it safer to leave my cask of arrack securely placed in the fork of a tree. To prevent the natives from drinking it, I let several of them see me put in a number of snakes and lizards; but I rather think this did not prevent them from tasting it. We were accommodated here in the verandah of the large house, in which were several great baskets of itried human heads, the trophies of past generations of head-hunters. Here also there was a littlo mountain covered with fruit-trees, and there were some maguificent Durian trees close ly the house, the fruit of which was ripe; and as the Dyaks looked upon me as a benefactor in killing the Mias which destroys a great deal of their fruit, they let us eat as much as we liked, and we revelled in this emperor of fruits in its greatest perfection.

The very day after my arrival in this place, I was so fortunate as to sloot another adult male of the small orang, the Mias-kassir of the Dyaks. It fell when dead, but caught in a fork of the tree and remained fixed. As I was very anxious to get it, I tried to persuade two young Dyaks who were with me to cut down the tree, which was tall, perfectly straight and stnooth-barked, and without a branch for fifty or sixty feet. To my surprise, they said they would prefer climbing up it, but it would be a good
deal of trouble, and, after a little talking together, they said they would try. They first went to a clump of bamboo that stood near, and cut down one of the largest stems. From this they chopped off a short piece, and splitting it, made a conple of stout pegs, about a foot long, and sharp at one end. Then cutting a thick piece of wood for a mallet, they drove one of the pegs into the tree and hung their weight upon it. It held, and this seemed to satisfy them, for they immediately began making a quantity of pegs of the same kind, while I looked on with great interest, wondering how they could possibly ascend such a lofty tree by merely driving pegs in it, the failure of any one of which at a good hoght would certainly cause their death. When abont two dozen pers were made, one of them began cutting some sery long and slemder bambon from another clump, and also prepared some cord from the bark of a small tree. They now drove in a peg very firmly at about three feet from the ground, and bringing one of the long bamboos, stood it upright close to the tree, and bound it firmly to the two first pegs, by means of the bark cord, and small notches near the head of each peg. One of the Dyaks now stood on the first peg and drove in a third, about level with his face, to which he tied the bambo in the same way, and then mounted another step, stauding on one foot, and holding by the bamboo at the peg immediately above him, while lie drove in the next one. In this puaner he ascended about twenty feet, when the upright bamboo becoming thin, another was handed up by his companion, and this was joined on by tying both bamboos to three or four of the pegs. When this was also nearly ended, a thirl was added, and shortly after, the lowest branches of the tree were reached, along which the young Dyak scrambled, and soon sent the Mias tumbling headlong down. I was exceedingly struck by the ingenuity of this mode of climbing, and the admirable manner in which the peculiar properties of the banboo were made available. The ladder itself was perfectly safe, since if any one peg wore loose or faulty, and gave way, the strain would be thrown on several others above and below it. I now understood the use of the line of bamboo peas sticking in trees, which I had often seen, and wondered for
what purpose they could have been put there. This animal was almost identical in size and appearance with the one I had obtained at Semabang, and was the ouly other male specimen of the simia morio which I obtainet. It is now in the Derby Museum.

I afterwards shot two alult females and two young ones of dificrent ages, all of which I preserved. One of the females, with several young ones, was feeding on a Durian tree with umripe fruit; and as soon as she saw us she began breaking off braches and the great sping fruits with every apmarance of rage, causing such a shower of missiles as effectually kept us from approaching too near the tree. This habit of throwing down branches when irritated has been doubted, but I have, as here narrated, observed it myself on at least three separate uccasions. It was however always the fumale Mias who behaved in this way, and it may be that the male, trusting more to his great strength and his powerful canine teeth, is not afroid of any other animal, and does not want to drive them away, white the parental instinct of the female leads her to adopt this mode of delending herelt and her young ones.

In preparing the skins and skeletons of these animals, I was mueh troubled by the Dyak dugs, which, being alway; kept in a state of semi-stavation, are ravenous for anmal frool. I had a great iron pan, in which I boiled the bones to make skeletons, and at night I covered this over with boards, and put heavy stones upon it; lom the dogs managed to remove these and carried away the greater part of one of my specimens. On another vecasion they gnawed away a good deal of the upper leather of my strons inoots, aul even ate a piece of my hosquito-curtain, where some laup-oil had been spilt over it some weeks before.

On our return down the strean, we hall the fortune to tall in with a yery old male Mias, feeding on some low trees growiug in the water. The country was floodel for a long distance, but so full of trees and stumps that the laden boat could not be got in among them, and if it could have been we should only have frightened the Mias away. I therefore got into the water, which was nearly up to nuy waist, and waded on till I was near enough for a shot.

The difficulty then was to load my gun again, for I was so deep in the water that I could not hold the gun sloping enough to pour the powder in. I therefore had to search for a shallow place, and after several shots under these trying circumstances, I was delighted to see the monstrous animal roll over into the water. I now towed lim after me to the stream, but the Malays objected t. have the animal put into the boat, and he was so heavy that I conld not do it without their help. I looked about for a place to skin him, but not a bit of dry ground was to be seen, till at last I found a clump of two or three old trees and stumps, between which a few feet of soil had collected just above the water, and which was just larget enough for us to drag the auimal uponit. I lirst measmres him, and found him to be ly far the largest I had yet seen, for, though the standing height was the same as the others ( $t$ feet 2 inches), yet the outstretehed arms were 7 feet 9 inches, which was six inches more than the previous ons. and the immense broad face was $13 \frac{1}{2}$ inches wide, whereas the widest I had hitherto seen was only $11 \frac{1}{2}$ inches. The girth of the body was 3 feet $7 \frac{1}{2}$ inches. I am intined to believe, therefore, that the length and strength of the arms, and the width of the fice, continues increasing to a very great age, while the standing height, from the sole of the: foot to the crown of the head, rarely if ever exceeds 4 fert 2 inches.

As this was the last Mias I shot, and the last time I saw an adult livius aumal, I will give a sketch of its general habits, and any other fucts connected with it. The Orang-utan is known to inhabit Sumatra and lhorneo, and there is every reason to believe that it is conlined to thess. two great islands, in the former of which, however, it seems to be much more rare. In Bomeo it has a wile range, inhabiting many districts on the south-west, somitheast, north-east, and north-west coasts, but appears to be chiefly confined to the low and swampy forests. It seems, at first sight, very inexplicable that the Mias should be quite unknown in the Sariwak valley, while it is abmudant in Sambas, on the west, and Sadong, on the east. But when we know the habits and morle of life of the animal, we see a sufficient reason for this apparent
anomaly in the physical features of the Sariwnk district. In the sudong, where I observed it, the Mias is only found when the country is low level and swampy, and at the same time covered with a lofty virein forest. From these swamps rise many isolated mountains, on some of which the Dyaks have settled, and covered with phantations of fruit trees. These are a great attraction to the Mias, which comes to feed on the unripe fruits, but always retires to the swampat night. Where the country becomes slightly elevated, and the soil dry, the Hias is no longer to be found. For example, in all the lower part of the Sidong valley it aboumds, hut as som as we ascend above the limits of the tides, where the countre, thoms still flat, is high emongt to be dry, it disappeas, Nuw the samak valley has this reculiarits-the lower fortion though swampy is not covered with continuous lofty forest, but is prinejpally ocoupied by the Nipa palm; and nom the town of Sarawak where the country beomes dry, it is greatly undulated in many parts, and covered with small patches of virgin forest, and much secomblarowth jungle on ground which has once been cultivated by the Malaya or Ibaks.

Now it seems to me probable, that a wide extent of mbroken and equally lofty virgin forest is necessary to the comfortathe existence of these animals. Such forests form their open country, where they can rom in every direction with as much facility as the ladian on the prairie, or the Arath on the thesen; passing from tree-top to tree-top without ever being obliged to descend upon the earth. The clevated and the drier districts are more frequented by man, more cut up by elemings and low second-growth jungle not adapted to its peculiar mode of progression, and where it would therefore be more exposed to danger, and more frequently obliget to deseend upon the earth. 'There is probably also a grater varicty of fruit in the Mias district, the small mountains which rise like jslands ont of it serving as a sont of gardens or plantations, where the trees of the uphands are to be found in the very midst of the swampy phains.

It is is simsular and very interesting sight to wateh a Mias making his way leisurely thrugh the forest. He walks deliberately along some of the lager branches, in
the semi-erect attitude which the great length of his arms and the shortness of his legs cause him naturally to assume; and the disproportion between these limbs is increased by his walking on his knuckles, not on the palm of the hand, as we should do. He seems always to choose those branches which intermingle with an aljoining tree, on approaching which he stretches out his long arms, and, seizing the opposing boughs, grasps them together with both hands, seems to try their strength, and then deliberately swings himself across to the next branch, on which he walks along as before. He never jumps or springs, or even appears to hurry himself, and yet manages to get along almost as quickly as a person can run through the forest bencath. The long and powertul ams are of the greatest use to the anmal, enabling it to climb easily up the loftiest trees, to seize fruits and young leaves from slender boughs which will not bear its weight, and to gather leaves and branches with which to furm its nest. I have already described how it forms a nest when wounded, but it uses a similar one to sleep on almost every night. This is placed low down, however, on a small tree not more than from twenty to fifty feet from the ground, probably because it is wamer and less exposed to wiml than higher up. Each Mias is satid to make a fresh one for himself every night; but I should think that is hardly probable, or their remains would be much more abundant; for though I saw several about the coal-mines, there must have been many Orangs about every day, and in a year their deserted nests would become very numerous. The Dyaks say that, when it is very wet, the Mias covers himselt' over with leaves of pandanus, or large ferns, which has perlaps led to the story of his making a hut in the trees.

The Orang docs not leave his bed till the sun has well risen and has dried up the dew upon the leaves. He feeds all through the middle of the day, but seldom returns to the same tree two days rumning. They do not seem much alarmed at man, as they often stavel down upon me for several minutes, and then only moved away slowly to an adjacent tree. Alter secing one, 1 have often Lad to go half a mile or more to fetel my gun, and in
nearly every case have found it on the same tree, or within a hundred yarls, when I returned. I never saw two fullgrown animals together, bat both males and females are sometimes aceompanied by half-grown young ones, while, at other times, three or four young ones were seen in company. Their food consists almost exclusively of fruit. with oceasionally leaves, buds, and young shoots. They seem to prefer unipe fruits, some of which were very sour others intensely bitter, particularly the large red, fleshy arillus of one which seemed an especial favourte. In other cases they eat only the small seal of a large fruit, and they almost always waste and destroy more than they ent, so that there is a continual rain of rejected portimis below the tree they are feeding on. The Datiau is in esperial favourite, and quantities of this dulicions froit ane destroyed wherever it grows surounded by forest, but thay will not cross clearimgs to get at them. It seems wonforftul how the amimal can tear open this frnit, the onter covering of which is so thick and tongh, and closely eavered with strong comical spines. It probably hites ritl a fow of these first, and then, making a small hole, tears open the fruit with its powerful fingers.

The Mins rarely descemb to the gromml, exeegt when. pressed by humger, it seeks for succulent shoots by the river sile; or, in very dry weather, has to seareh aftur water, of which it gemerally finds sulfetent in the hollows of leaves. Once only 1 saw two half-grown trangs on the ground in a dry lallow at the foot of the simungon bill. They were playing together, standing ereet, and graspinge cach other lyy the ams. It may be safely stated, however, that the Orang nover walks erect, unless when using its hands to support itself by banches overhead or when attacked. Jheresentations of its walking with a stick are entirely imacinary.

The Dyaks all declare that the Mias is never attacked by any animal in the forest, with two rate excentions; and! the accounts I received of these are so cmons that I give them nearly in the words of my informants, old Dyak chiefs, who had lived all their lives in the places where the animal is most abundant. The first of whom I inquired said: "No animal is strong enough to hurt the

Mias, and the only creature he ever fights with is the crocodile. When there is no fruit in the jungle, he gnes to seek food on the banks of the river, where there are phenty of young shoots that be likes, and fruits that grow close to the water. Then the crocodile sometimes tries to seize him, but the Mias gets upon him, and beats him with his hands and feet, and tears him and kills him." He added that he had once seen such a fight, and that he believes that the Mias is always the victor.

My next informant was the Orang Kaya, or chief of the Balow Dyaks, on the Simunion Tiver. Ite said: "The Mins has no cnemies; no animals dare attack it but the crocolile and the python. Ite always kills the crocolile by main strength, standing upon it, julling open ita jaws, aud ripping up its throat. If a python attacks a Mias, he seizes it with his hands, and then bites it, and soon kills it. The Miats is very strong ; there is no animal in the jungle so stroug ns lie."

It is very remarkable that an animal so large, so preculiar, and of such a high type of form as the Orangutan, should be confined to so limited a district-to two islands, and those almost the last inhabited by the higher Mammalia; for, eastward of Borneo and Java, the Quadrumania, Ruminants, Carnivora, and many other gromps of Mammalia, diminish rapidly, aud soon entirely disappear. When we consider, further, that almost all other animals have in earlier ages been represented by allied yet distinct forms-that, in the latter part of the tertiary period, Europe was inhabited by bears, deer, wolves, and cats; Australia Ly kangarons and other marsupials; South America by gigantic sloths and ant-eaters; all different from any now existing, though intimately allied to them-we have every reason to believe that the Oran-utan, the Chimpanzee, and the Gorilla have also had their foremumers. With what interest must every naturalist look forward to the time when the caves and tertiary deposits of the tropics may be thoroughly examined, and the past history and earliest appearance of the great man-like apes be at length made known.

I will now say a few words as to the supposed existence
of a Pornean Orang as large as the Gorilla, I have myself exanined the bodies of seventeen freshly-killed Orangs, all of which were carefully measured; and of seven of them I preserved the skeleton. I also obtained two skeletons killed by other persons. Of this extensive series, sixteen were fully adult, nine being males, and seven females. The adult males of the large Orangs only varied from 4 feet 1 inch to 4 feet 2 inchers in heisht, measured fairly to the heel, so as to pive the height of the animal if it strod perfectly ereet; the extent of the outstretched arms, from 7 feet 2 inches to 7 feet 8 inches; and the width of the face, from 10 inches to $13 \frac{1}{4}$ inches. The dimmsions given ly other natmatists closely agree withe mine. The largest Orang measured by Temminck was 4 feet hich. of twenty-five specimens collected by Schlecel and Muiller, the largest old male was 4 feet 1 inch; and the largest skeleton in the Calcutta Museum was, according to Mr. Blyth, 4 fect $1 \frac{1}{2}$ inch. My specimens were all from the north-west const of Dorneo ; those of the Dateh from the west and soutls coasts; and no specimen has yet reached Europe exceeding these dimensions, although the total number of skius and skeletons must amount to over a hundred.

Strange to sily, however, several persons declare that they have measimed Oraniss of a much larger size. Temminck, in his Monograhh of the Orang, says, that he has just received news of the capture of a specimen 5 feet 3 inchers high. Unfortunately, it never seems to have renched Ifolland, for nothing has since been heard of any such mimal. Mr. St. John, in lis "Life in the Forests of the liar East," vol. ii. p. 237, tells us of an Orang shot ly a friend of his, which was 5 feet 2 inches from the heel to the top of the head, the arm 17 iuches in girth, and the wrist 12 inches! The head alone was hrought to Satiowa, and Mr. St. John tells us that he assisted to masure this, and that it was 15 inches broad by 14 long. Unfortunately, even this skull appars not to have been preserved, for no specimen corresponding to these dimeusions has yet reached England.

In a letter from Sir James Brooke, dated Octooer 1897, in which he acknowledges the receipt of my Prapers on the

Orang, published in the "Aunals and Magazine of Naturel History," he sends me the measurements of a specimen killed by his mephew, whiel I will give exactly as I received it: "September Bhl, 1867, killed female Orangutan. Height, from head to heel, 4 leet 6 inches. Stretch from fingers to fingers actoss borly, 6 feet 1 inch. Breadth of face, including callosities, 11 inches." Now, in these dimensions, there is palably ono ertor; for in every Orang yet measured by any naturalist, an expanse of arms of 6 feet 1 inch correspomels to a height of abont 3 feet 6 inches, while the largest specimens of 4 feet to 4 feet 2 inches high, alwoys have the extended arms as much as 7 feec 3 inelnes to 7 fret 8 inches. It is, in fact, one of the chatacters of the genus to have the arms so long that an amimal standing nearly erect can rest its fingers on the ground. A height of if feet 6 inches would therefore require a stretel of arms of at least 8 feet! If it were only 6 feet to that leught, as given in the dimensions quoted, the animal woulil not be an Orang at all, but a new genus of apes, differing materially in habits and mode of progression. But Mr. Johmson, who shot this animal, and who knows Orangs well, evidently considered it to be one; and we have therefore to judge whether it is more prohable that he mate a mistake of two feet in the stretely of the arms, or of one foot in the height. The latter error is certainly the easiest to make, and it will bring his animal inta agreement, as to proportions and size, with all those which exist in Europe. How ensy it is to be deceived in the leeight of these animals is well shown in the case of the sumatran Orang, the skin of which was described by Ir. Clarke Abel. the captain and erew who killed this animal declared, that when alive be exceeded the tallest man, and looked so gigantic that they thought he was 7 feet high; but that, when he was killed and lay upon the gromul, they foumd he was only about is feet. Now it will hardly be credited that the skin of this identical animal exists in the Calcutta Museum, and Mr. Blyth, the late curator, states "that it is by no means one of the largest size; " which means that it is about 4 feet high!

Having these undoubted examples of error in the
dimensions of Orangs, it is not too much to conclude that Mr. St, John's friend made a similar error of mensurement, or rather, pelaps, of memory ; for we are not told that the dimensions were noted down at the time they wre made. The only figures given by Mr. St. John un his own authority are that "the head was 15 inches hrout ly 14 inches long." As my largest male was $1:$ in $^{\prime}$ hood across the face, mensured as soon as the animal was killed, I can quite understand that when the lead amived at Sarawak from the Jatang Lupar, alter two if not three days' rogage, it was so swollen by decompositinn as to measure an inch more than when it was fresh. Un the whole, therefore, I think it will be allowed, that up to this time we have not the least relable evidence of the existence of Orangs in Borneo more than 4 feet 2 inches high.

## CHAPTER V.

BORNEO-JOURNEY IN TIE INTERIOR.

## (sovembet 1855 to Januany 1856.)

AS the wet season was approaching 1 determined to return to Suriwak, sending all my collections with Chades Allen round by sea, while I myself proposed to go up to the sources of the Sidong liver, and descend by the Sariwak valley. As the ronte was somewhat difticult, I took the smallest quantity of haqrage, and only one servant, a Mahay lad naneal Bujon, who knew the language of the satong Dyaks, with whom he had traded. We left the mines on the 27 th of November, and the next day reabed the Malay village of Gidong, where I stayed a short time to buy fruit and egres, and called upou the Datu Bandar, or Malay governor of the place. He lived in a large and well-built house, very dirty outside and in, and was very imulisitive about my business, and particularly about the coal mines. These puzzle the natives exceedingly, as they
cannot understand the extensive and costly preparations for working eoal, and cannot believe it is to he used only as fice when wood is so abundant and so easily obtained. It was evident that Europeans seldom came here, for numbers of women skeltered away as I walked through the village: and one ginl about ten or twelve years ohd, who had just brought a bamboo full of water from the river, threw it down with a cry of horror and abrm the moment she caught sight of me, turned rouml and jumpeal into the strean. She swam beautifully, and kept looking back as if expecting I would follow her, screaming violently all The time; while a number of men and boys were laghing at her ignorant terror.

At Jahi, the next villare, the strean became so swift in fonsequence of a flood, that my heavy boat combl make no way, and I was obliged to send it back and go on in a very small open one So far the river had been very monotonous, the banks beiner cultivated as rice-fields, and lithe thatched hats aloue breaking the nupletwesque line of muddy bank crowned witle tall grasses, and backed by the top of the forest behind the cultivated gromad. A few hours beyond Jahi we passed the limits of eulivation, and had the heautiful virsin forest coming down to the water's edge, with its palms and ereepers, its noble trees, its ferns, and epiphytes. The banks of the river were, however, still generally flooded, and we lad some difticulty in finding a dry spot to sleep on. Early in the morning we reached Empugnan, a smatl Malay village situated at the foot of an isolated mountain which had been visible from the month of the Simunjon liver. Beyond here the tides are not felt, and we now enterel upha a district of elevatel forest, with a finer vegetation. Larre trees stretch out their arms across the stream, nod the steep, eathy banks are clothed with ferns and zingibericeous plants.

Early in the afternoon we arrived at Tabokan, the first village of the Lill Dyaks, On m open space near the river about twenty boys were playing at a game something like what we call "prisoner's base;" their ornaments of heads and brass wire and their gayacoloured ketchiefs and waist-cloths showing to much advantage, and torming a very pleasing sisht. On being ealled hy Bujon, they imme-
diately left their game to carry my things up to the "head-house,"-a cirentar building attreled to most Jyak villages, and serving as a lodging for strangers the place. for trade, the slepring-room of the unmarried youths, and the general commeil-chanber. It is elevated on hofty bosts. has a large fireplace

forthat of hyale votth. in the middle and windows in the root all round, and forms a very pleasant and comtortable abode. In the evening itwas crowded with young men and boys, who came to look at me. They were mostly fine young fellows, and 1 could not help admining the sinsplicity and elegauce uf their costume. Their only dress is the long "cliawat," or waist-cloth, which hangs down before and behind. lt is generally of lulue cotton, ending in three broad bands of red, blue, and white. Those who can aftorl it wear a landkerehief on the head, which is either red, with a narrow border of gold lace, or of three colours, like the "chawat." The large flat mom-shaped brass earrings, the heavy necklace of white or black beads, rows of brass rings on the ams anel legs, and armets of white shell, all sarve to relieve and set ofl the pure reddish brown skin and jet-black hair. Adel to this the little pouch containing materials for betel-chewing and a long slendra knife, both invariably worn at the side, and you have the every-day dress of the young Dyak gentlemtn.

The "Orang Kaya," or rich man, as the chief of the tribe is called, now came in with several of the older men; and the "bitchara" or talk commenced, about getting a boat and men to take me on the next morning. As 1 could not understand a word of their language, which is very different from Malay, I took no part in the proceedings, but was represented by my boy Bujon, who translated to me most of what was said. A Chinese trader was in the house, and he, too, wanted men the next day; bat on his hinting this to the Orang Kaya, he was stemly told that a white man's business was now being discussed, and he must wait another day before his could le thought about.

After the "bitchara" was over and the old chiefs gone, I risked the young men to play or dance, or amuse themselves in their accustomed way; and after some little hesitation they agreed to do so. They first had a trial of strength, two boys sitting opposite each other, foot being placed against foot, and a stout stick grasped by both ikeir hands. Each then tried to throw himself back, so as to maise his adversary up from the ground, either by main strength or by a sudden effort. Then one of the men would try his strength against two or three of the hoys; and afterwads they each grasjed their own ankle with a hand, and while one stood as limm as he could, the other swung himself round on one leg, so as to strike the other's free leg, and try to overthrow him. When these games had been played all round with varying success, we lad a novel kind of concert. Some placed a leg across the knee, and struck the fingers sharply on the ankle, others beat their arms against their sides like a cock when he is going to crow, thus making a great variety of clapping sounds, while another with his hand under his armpit produced a deep trumpet note; and, as they all kept time very well, the effect was by no means unpleasing. This seemed quite a favourite amusement with them, and they kept it up with much spirit.

The next morning we started in a boat about thirty feet long, and only twenty-eight inches wide. The stream here suddenly changes its character. Hitherto, though swift, it had been deep and smooth, and confined by steep banks. Now it rushed and rippled over a pebbly, sandy, or rocky
bed, occasionally forming miniature cascades and rapids, and throwing up on one side or the other broad banks of finely coloured pebbles. No paddling could make way here, but the Dyaks with bamboo poles propelled us along with great dexterity and swiftuess, never losing their balance in such a narrow and unsteady vessel, though standing up and exerting all their force. It was a brilliant day, nad the cheerful exertions of the men, the rushing of the sparkling waters, with the bright and varied folinge which from either bank stretched over our heads, produced an exhilarating sensation which recalled my canoe voyages on the grander waters of South America.

Early in the aftemoon we reached the village of Borotofi, and, though it would have been casy to reach the next one before night, I was obliged to stay, as my men wated to retum and others could not possibly go on with me without the preliminary talking. Besides, a white man was too great a rarity to be allowed to escape them, and their wives would never have forgiven them if, when they returnal from the fields, they found that such a curiosity had not been kept for them to see. On catering the honse to which I was invited, a crowd of sixty or seventy men, women, and clildren gathered round me, and I sat for half an hour like some strange animal submitted for the first time to the gaze of an inquiring public. Brass rings were here in the greatest profusion, many of the women having their arms completely covered with them, as well as their legs from the ankle to the knee. Round the waist they wear a dozen or more coils of fine rattan stained red, to which the petticoat is attached. Below this are generally a number of coils of brass wire, a girdle of small silver coins, and sometimes a broad belt of brass ring armour. On their leads they wear a conical hat withont a crown, formed of variously coloured beads, kept in shape liy rings of rattan, and forming a fantastic but not unpicturesque head-dress.

Waiking out to a small hill near the village, cultivated as a rice-field, I had a fine view of the country, which was becoming quite hilly, and towards the south, mountainous. I took bearings and sketches of all that was visible, an operation which caused much astouishment to the Dyaks
who accompanied me, and produced a request to exhibit the compass when l returned. I was then surounted by at lager crowd than before, and when I took my evening meal in the midst of a circle of about a hundred spectators anxiously observing every movement and criticising every mouthful, my thoughts involuntarily recmed to the lions at leeding time. Like those noble animals, I too was used to it, and it did not alfect my apetite. The chidren here were more shy than at Tabokan, ind I coukd not persuade thenn to phay. I therefore turned shownana myself, and exhibited the shatow of a dog's head eating, which pleased When so muth that all the village in suceession came out to see it. The "rabbit on the wall" does not do in loorneo, as there is no animal it resembles. The boys hari lops shaped sonething like whipping-tops, but spun with a string.

The next murniner we proceeded as before, hat the river had becone so rapil and shallow and the bonts were all so small, that though I hal nothing with me but a change of clothes, a gha, and a fesw cooking utonsils, two were required to take we on. The rock which appeared here and there on the river-houk was an indurated chay-slate. sometimes crystalline, and thrown up almost vertically. Kiyht and left of us rose isolated limestone monutains, their white precipices glistening in the sun and contrastiog heatifilly with the luxuriant vegetation that elsewher: clothed thetm, The river bed was a mass of pebbles, mostly pure white quarta, but with abumlance of jasper and arate, presenting a beautifully vari-gated apparance. It was only ten in the morning when we arrived at Budw, and, thongh there were plenty of poople about, I could nut indace them to allow me to go on to the next village. The Orang Kaga said that if I insisted on laving men, of comrse he would get them, but when I took him at his word aud said 1 mast have them, there came a fresh remonstrance; and the idea of my going on that day seemed so painful that I was obliged to submit. I therefore walked out over the rice-fichls, which are here very extensive, covering a number of the little hills and valleys into which the whole country seems broken up, and obtained a fine view of hills and momntains in every direction.

In the evening the Orang Kaya came in full dress (a spangled velvet jacket, but no trowsers), aut invited me over to his house, where he gave me a seat of honour under a canopy of white calico and coloured handkerchiefs. The great verandal was crowded with people, and large plates of rice with cooked and fresh eggs were placed on the ground as presents for me. A very old man then dressed himself in bright-coloured cloths and many ornaments, and sitting at the door, murmured a long prayer or invocation, sprinkling rice from a basin he held in his land, while several large gongs were loudly beaten and a salute of muskets fired off. A large jar of nice wine, very sour but with an agreeable ilavour, was then hauded round, and I asked to see some of their dances. These were, like most savage performances, very dull and ungraceful affairs; the men dressing themselves absurdly like women, and the girls making themselves as stifi and ridiculous as possible. All the time six or eight large Chinese gongs were being beaten by the vigorous arms of as many young men, producing such a deatening discord that I was glad to escape to the round house, where I slept very comfortably with halt' a dozen smokedried human skulls suspended over my heat.

The river was now so shallow that boats could hardly get along. I therefore preferred walking to the next village, expecting to see something of the country, but was much disappointed, as the path lay almost entirely through dense bamboo thickets. The Dyaks get two crops off the ground in succession; one of rice, and the other of sugar-cane, maize, and vegetables. The ground then lies fallow eight or ten years, and becomes covered witlt bamboos and shrubs, which often completely arch over the path and shut out everything from the view. Three hours' walking brought us to the village of Senánkan, where I was again obliged to remain the whole day, which I agreed to do on the promise of the Orang Kaya that his men should next day take me through two other villages across to Sénua, at the head of the Sarawak River. [ amused myself as I best could till evening, by walking about the high ground near, to get views of the country and bearings of the chief mountains. There was then
mother public andience, with gifts of rice aut eggs, and driuking of rice wine. These Dyaks cultivate a grat oxtent of ground, and supply a good deal of rice to Sariwak. They are rich in gongs, brass trays, wire, silver coins, and other articles in which a Dhak's wealth consists ; and their women and children are all highly ornamented with bead neeklaces, shells, and brass wire.

In the norning I waited some time, but the men that were to accompany me did not make their apparance. Un sending to the Orang Kaya I found that both he and another head-man had gone out for the day, and on inquiring the reason was tord that they could not persuade any of their men to go with me because the journey was a long and fatiguing one. As I was determined to get on, I told the few men that remained that the chiefs hat behaved very badly, and that I should acquaint the Rajah witl: their conduct, and I wanted to start immediately. Every man present made some excuse, but others were sent for, and by dint of threats and pronises, and the exurtion of all Bujon's eloquence, we succeeded in getting ofl after two hours' delay.

For the first few miles our path lay over a conuty clearel for rice-fields, consisting entirely of smatl but deep and sharply-cut ridges and valleys, without a yard of level ground. Alter crossing the Kayan River, a main branch of the Sadong, we got on to the lower slopes of the Seboran Mountain, and the path lay along a sharp and moderately steep ridge, affording an excellent view of the country. its features were exactly those of the Jimalayas in miniature, as they are described by Dr. Hooker and other travellers; and looked like a natural model of some parts of those vast mountains on a seale of alonat a tenth thousands of feet being here represented by humdreds. I now discovered the source of the beatitul pebbles which had so pleased me in the river-bed. The slaty rocks had ceased, and these monntains seemed to consist of a sandstone conglomerate, which was in some places a mere mass of pebbles cemented together. I might have known that such small streams could not produce such vast quantities of well-rounded pebles of the very hardest materials. They had evidently been formed in past ages,
by the action of some continental strem or seabeach, before the great island of Burneo had risen from the ocean. The existence of such a system of hills and valleys reprodueing in miniature all the features of a great mountain region, has an important baring on the nodern theory, that the form of the ground is mainly due to atmospheric rather than to subtermata action. When we base a number of hanching valleys and savines romaing in many diferent directions within a square mile, it seems hardly passible to impute their formation, or even their origimtion, to rents and tissures produced by earthrpakes. On the other hand, the nature of the rock, so easily decomposed and removed by water, and tle known action of the ahbulant tropical mans, are in this case, at least, quite sutlicient causes fir the proluction of such valleys. But Hee resomblanee between their forms and oullines, their monde of divergence, and the slopes and ridges that divide them, and those of the errand monntain semery of the Itimatayas, is so remadiable, that we are formbly led to the conclusion that the fonces at wow in the two cases lave been the sime, diffong only in the thane they have been in action, and the nature of the material they have had to work upon.

About nown we reached the village of Menyery, hantifully situated on a spur al the monntain about bu0 fetet above the valley, and allording a delightitul view of the mountains of this part of Boneso. I here yot a sight of Henrissen Mountain, at the head of the Sinciwak River. and one of the dionest in the district, rivine to about 0,000 fiect ntrove the sta, To the sonth the hewan, and further off the Untnwan Monatains in the Duteh territory, appeared equally loty. Dhecmdins from Menyerry we: again crossed the kaym, which bonds round the spre, and ascended to the fass which thivites the sidong and Sariwak valleys, and which is about 2,000 leet high. The descent from this point was very time. A stream, deep in at rocky gorge, rushed on each side of us, to one of which we gradually desceuded, passing over many lateral gulleys and along the faces of some precibices by means of hative bamboo bridges. Some of these were several hundret feet long and fifty or sixty high, a single smooth bamboo
four inches dimeter forming the only pathway, while a sleuder handrail of the same material was often so shaky that it could only be used as a guide rather than a support.

Late in the afternoon we reached Sodos, situated on a spur between two streams, but so surronnded by fruit trees that little could be seen of the country. The hous. was spaciuns clean and comfortable, and the people ver: obliging. Many of the women and children had never seen a white man before, and were very sooptial as to my leing the same colour all over, as my face. Thes tanged me to show them my ams and lndy, and they were so kime and gond-tempered that I telt bound to give them sume satistaction, so I turned up my tronsers and let then see the colour of my leg, which they examined with great interest.

In the moming early we continned our desent atomer a tine valley, with mountans rising 2,000 or $8,0,000$ feet in every ditection. The little river muidly incruad in sizs: till we reached Senna, when it hat beronne a dine pebbly stream havigatibe for smatl cethoes. Here arain the unheaved slaty rock appeared, with the same dip and diaertom as in the Sinlomg River. On inyniting for a hatat th take me down the strean, I was told that the senam I yaks, althongh living on the river-banks, bever made in used boats. They were mountameers wher han only conne down into the ralley about twenty yeats hefore, and hat not yet got into new labits. They are of the same tribu. as the people of Menyerry and Solos. Thery make gomat paths and bridees, and culivate much monatain lamel, amb thas give a mote plasing and civilizen anpet to tha conntry than where the poople move abmat onty in hats, and confae their cultivation to the banks of the streame

After some trouble [ hireal a bat frona a Malay trader, and found three Draks who had been sewom times with Malays to Sarawak, and thonght they combl mamage it very well. They turned out very awkward, constantly rmming agromm, striking against rocks, and losing their halance so as almost to apset themselves and the boat; wfiering a striking contrast to the skill of the Sua Dyaks. At length we cane to a ratly dangerons rapid whera
boats were often swamped, and my men were afraid to pass it. Some Malays with a boat-lond of rice here overtook us, and after safely passing down kindly sent back une of their men to assist me. As it was, my Dyaks lost their balance in the critical part of the passage, and had they been alone would certainly have upset the boat. The river now became excendingly picturesque, the ground on each side being partially cleared for rice-fields, aflording a good view of the country. Numerons little granaries were built high up in trees overhanging the river, and having a bamboo bridge sloping up to them from the bank; and here and there bamboo suspension bridges crossed the stream, where overhanging trets favoured the ir construction.

I slept that night in the village of the Sebungow Dyaks, and the next day reached sariwak, passing through a most beautiful conntry, where limestone monntuins with their fantastic forms and white precipices shot up on every side, draped and festooned with a luxuriant vegetation. The banks of the Sarawak River are everywhere covered with fruit trees, which supply the Dyaks with a areat deal of their food. The Mangosteen, Lansat, Rambutan, Jack, Jambou, aud llimbing, are all abundant; but most abundant and most esteemed is the Durian, a fruit about which very little is known in Englamd, but which both by natives and Luropeans in the Malay Archipelago is reckoned superior to all others. The old traveller Linschott, writing in l599, says:-" It is of such an excellent taste that it surpasses in havour all the other fruits of the world, according to those who have thsted it." And Ductor Patudanus adds :-" This fruit is of a hot and humid mature. To those not used to it, it seems at dirst to smell like rotten onions, but immediately they have tasted it they prefer it to all other food. The matives give it honourable titles, exalt it, and make verses on it." When brought into a house the smell is often so offensive that some persons can never bear to taste it. This was my own case when I first tried it in Malacea, but in Borneo I found a ripe fruit on the ground, aud, eating it out of doors, I at once becane a confirmed Duriau eater.

The Duriau grows on a large and lofty forest tree, somewhat resembling an elm in its general character, but with a more smooth and scaly bark. The fruit is round or slightly oval, about the size of a large cocomut, of a green colour, and covered all over with short stout spines the bases of which touch each other, and are consequently somewhat hexagonal, while the points are very strong and sharp. It is so completely arined, that it the stalk is lroken off it is a difficult matter to lift one from the ground. The outer rind is so thick and tough, that from whatever height it may fall it is never broken. From the base to the apex five very faint lines may be traced, over which the spines arch a little; these are the sutures of the carpels, aud show where the fruit may be divided with a heavy knife and a strong hand. The five cells are satiny white withiu, and are each filled with an oval mass of cream-coloured pulp, imbedded in which are two or three seeds about the size of chestmuts. This pulp is the eatable part, and its consistence aud llavour are indescribable. A rich butter-like custard highly ilavoured with almonds gives the best general idea of it, but intermingled with it come wafts of tlavour that call to mand crean-cheese, onion-sauce, brown sherry, and wher inconqruities. Then there is a rich glutinous smoothess in the pulp which nothing else pussesses, but which adds to its delieacy. It is neither acid, nor sweet, nor juicy, yet one feels the want of none of these rualities, for it is perfect as it is. It produces no masea or other bad effect, and the more you eat of it the less you feel inclined to stop. In fact to eat Durians is a new seusation, worth a voyage to the East to experience.

When the fruit is ripe it falls of itself, and the only way to eat Duriaus in perfection is to get them as they fall; and the smell is then less overpowerisg. When unripe, it makes a very good vegetable if cooked, and it is also eaten by the Dyaks raw. In a good fruit season large quantities are preserved saltel, in jars and bamboos, and kept the year round, when it acquires a most disgusting odour to Europeans, but the Dyaks appreciate it highly as a relish with their rice. There are in the forest two varietics of wild Durians with much smaller fruits, one of
them orange-coloured inside; and these are probably the wign of the lage and fine Durians, which are never found wild. It would not, perhaps, be correct to say that the Hurian is the best of all fruits, becanse it camot supply the phace of the sulacid juicy kinds, such as the orange, grape, mango, and mangesten, whose refreshing and couliug qualities are so wholesome and grateful; but as prodheing a fool of the most expuisite lavour it is ansurpassed. If I had to tix on two only, as representing the perfection of the two classes, I should certainly choose the Durian anl the Orange as the king and queen of fruits.

The Durian is, however, sometimes dangerous. When the: fruit heyins to ripen it falls daily and umost hourly, and aceidents not unfrequently happen to persons walking in working muler the trees. When a Durian strikes a man in its foll, it produces a dreadful womed, the strong spines tearing open the Hesh, while the blow itself is very litavy; hut from this very circunstance death marely ensues, the copions eflusion of houl preventing the inHhmmation whicla might otherwise take phace A Dyak chief informed we that he had heen struck down by a 1)urian falling on his hearl, which he thought womb certainly have cansed his death, yet he recorered in a very short time.

I'mets and momatists, juhing fron our Emplish trees and fruits, have thought that small fruits always grew on lofty trees, so that their fall should be harmess to man, while the large ones trailed wh the gromed. Two of the largest and heaviest fruits known, however, the Brazil-mut frnit (Bertholletia) aud Durim, grow on lufty forest trees, from which they fall assom tat they are ripe, and olien wound or hill the native imbabiants. Fron this we may learn two things: first, mot to draw remeral conclusims from a very partial view of mature; and seeondly, that trees and fruits, no less than the varied productions of the animal kingtom, do mot appear to be organized with exclusive reference to the use and convenience of man.

Daring my many journeys in Bomeo, and especially during my various residences among the Dyaks, I first came to appreciate the admirable qualities of the Bamboo. In those parts of South America which I had previously
visited, these gigantic grasses were comparatively srave ; and where fomd but little used, their phase heing taken as to one class of uses by the great varicty of l'ahns. and as to amother by calabashes and gourds. Amost all tropioal countries produce Bamboos, and wherever they are foumd in abundance the natives apply them to a variety of ustes. Their strengh lightness smoothuess straightness romulness and hollowness the ficility and regularity with which they can be split, their many different sizes, the varying length of their joints, the ease with which they can be cut and with which holes can be made though them, their hardness ontside, their freedom from any pronounced taste or smell, their great abundance, and the rapidity of their growth and inerease, are all qualities which remder them useful fur a lundred different purposes, to serve which other materials would reguive mach more labur and preparation. The Bamboo is one of the most wonderfal and most beautiful productions of the tropics. and one of nature's most valuable gifts to uncivilized man.

The Dyak houses are all raised on posts, and are often two or three humdred feet long and forty or filty wide. The floor is always formed of strips split from large lhambos, so that each may be nearly ilat and about thee inches wide, and these are firmly tied down with rattan to the goists beneath. When well made, this is a delightful Hom to walk upon harefooted, the rounded surfaces of the bamboo being very smooth and agreenble to the feet, while at the same time affording a firm hold. But, what is more important, they form with a mat over them an excellent Herl, the elasticity of the Babboo and its rounded surface luing far superior to a more rigid and a flatter floor. Here we at onee find a use for Bumbon which camnot Ins supplied so well by auother material without a vast amount of labour, palms and other substitutes requiring much cutting and smoothing, and not being equally good when finished. When, however, a bat, close tloor is required, excellent boards are male by splittiug open large Bamboos on one side only, and flatteniog them out so as to form slabs eighteen inches wide and six feet long, with which some Dyaks floor their houses. These with con-
stant rubbing of the feet and the smoke of years become dark and polished, like walnut or old oak, so that their real material can hardly be recognised. What labour is here saved to a savage whose only tools are an axe and a knife, and who, if he wants boards, must hew them out of the solid trunk of a tree, and must give days and weeks of labour to obtain a surface as smooth and beautiful as the Bamboo thus treated affords lim. Again, if a temporary house is wanted, either by the native in lis plantation or by the traveller in the forest, nothing is so convenient as the Bamboo, with which a house can be constructed with a quarter of the labour and time than if other materials are used.

DYAK CHOEBINO A DASIVO BHIDGE
As I have already mentioned, the Hill Dyaks in tlue interior of Saráwak make paths for long distances from village to village and to their cultivated grounds, in the course of which they have to cross many gullies and ravines, and even rivers; or sometimes, to avoid a long circuit, to carry the path along the face of a precipice. In all these cases the bridges they construct are of Bamboo, and so admirably adapted is the material for this purpose,
that it seems doultful whether they ever would have attempted such works if they had not possessed it. The Dyak bridge is simple but well designed. It consists merely of stout Bambos crossing each other at the roadway like the letter X , and rising a few feet above it. At the crossing they are firmly bound touether, and to a large Pamber which liys upon them and forms the only pathway, with a slender and often very shaky one to serve as a landrail. When a river is to be crossed an overhanging tree is chosen, from which the bridge is partly suspended and partly supported ly diagoual struts from the banks, so as to avoid placing phats in the stream itself, which would he liatle to the carried away by floods. In carrying a ${ }^{\text {ath }}$ along the fare of a preipice, trees and roots are mald use of for susjemsion : struls arise from suitable notches or crevices in the rooks, and if these are not sufficient, immornse lambons fifty or sixty feet lomo are fixed on the lauks or ou the brimeh of a tree below. These bridges are traversen daily loy men and wonen carrying heavy louds, so that any insenrity is som disonered, and, as the materials are close at hand, immedintely repaired. When at path crows over very steep ground, and hecomes slippery in very wet or very dry weather, the bambor is usel in :mother way: l'jeers are cut about a yard long, and opposite untiones heing moule at cach end, holes are formend through which purs are driven, and firm and convenient steps are thens formed with the greatest case and celerity. It is true that much of this will decay in ore or two seatsons, but it can be so quickly rephaced as to make it more economical than usiug a harder aud more durable wood.
One of the mast striking uses to which Damboo is applied by the Dyaks, is to assist them in climbing lofty trees, by driving in pegs in the way I have already described at pare an. This method is constantly used in $^{2}$ order to ohtain wax, which is one of the most valuable products of the country. The homey-bee of horneo very generally hangs its combs under the brabches of the Tappan, a tree whieh towers above all others in the forest, and whose smooth cylindrical trouk often rises a hundred feet without a branch. The Dyaks climb these
lofty trees at night, building up their Bamboo ladder as they go, and bringing down gigantic honeycombs. These fumish them with a delicions feast of honey and young heees, besinles the wax, which they sell to traders, and with the proceals buy the much-coveted brass wire, earriugs, and fold-edged handkerchiefs with which they love to decorate themselves. In ascending Durian now other fruit trees which branch at from thirty to fifty feet from the pround, I have seen them use the Bambo pees onls, withont the umpight Bamboo which renters them so mued more secure.

The outer rim of the Pamhoo, split and shaved thin, is the strongest material for laskets; hen-coops, bird-cages, and coniend fish-traps are very quickly made from a singh joint, by splitting off the skin in mamow strips left attached to one end, while rings of the same material or uf rattan are twisted in at regular distanees. Water is brought to the honses by little aqueducts formed of large Bamboos split in half and supported on crossed sticks of varbus leights so as to give it a mgular fall. Thin hosjonited Tomboos form the Dyaks' only water-vessels, and a dozen of them stand in the corner of every lonse. They are chan, light, and easily carried, and are in many ways superior to earthen vessels for the same purpose. They also make excellent cooking utensils; vegetables and rice an be boiked in then to perfection, and they are often used when travelling. Salted fruit or fish, sugar, vinegar, and honey are preserved in them instead of in jars or bottles. In a small Bamboo case, prettily carved and ormmented, the Dyak carries his sirila and lime for betel Whewing, and his little long-bladed knife has a Damboo sheath. His farourite pipe is a huge hubble-bubble, which he will comstruet in a few minutes by inserting a small piece of Bamboo for a low obliquely into a large cylinder abuat six inches from the bottom containing water, through which the smoke passes to a long sleuder Bamboo tube. There are many other small matters for which Bamboo is daily used, lint enough has now been mentioned to show its value. In other parts of the Archipelago I have myself seen it applied to many new uses, and it is probable that my limited means of observation did not make
me acquainted with one-lall the whys in which it is serviceabie to the Dyaks of Striwak.

While upon the suliject of plants I may here mention a faw of the mor striking vegetable probluctions of Bomen. The wonderfinl liteher-plants, forming the genus Nepenthess of lowanists, here reach their greatest development. Every monntais-tup abounds with them, ruming atong the ground, or climbing over shmben and stunted trees: their elemat pitehers hanging in every elirection. Sman of these are long and slender, resemilines in form the homatifil Ihilippine lace-sponge (Fuplectella), which las muw loechate so common; of hers are brond ant short. Their colums are gren, varionsly tinted and mottlet with mad w: purph. The tinest yot known were ubtainet on the swmant of Kini-baton, in North-west Bomen。 One of the lymerl surt, Nepontlos raght, will hold two quarts of water in its pildher: Another, Nepenthes Elwarlsiania, has a namon pitelar twenty inches long; while the plame itself shows to a length of twenty feet.

Frms are abumdant, but are not so varied as on the voleanic mountains of Java; and Tree-fems are neithers su phentiful mor so large as in that island. They grow, howwel. guite down to the level of the sea, amb are gencmally shumer and oraceful plants from eight to filteen feet high. Without duroting moch time to the search I eollected difty species of Ferns in Bomeo, and I hase no doubt a goom botanist would have obtaind twice the momber. The interesting group of Orchids is very atmodant, hat, as is grmerally the case, nine-tenths of the species have small and inemspienons flowers. Among the excegtions are the fine Corlogynes, whose lange chasters of yellow flowers ornament the glomiest forests, and that most extraordinary plant, Vanda Lowii, which last is particularly abundant near some lont springs at the foot of the I'minjual Mome tain. It grows on the lower branches of trees, and its strange jemrtant flower-spikes often lang down so as alnost to rach the ground. These are generally six or eight feet long, hearing large and handsome flowers three inches across, and varying in colour from orange to red, with deep purplered spots. I measured one spike, which reached the extraordinary length of nine feet (ris) it inches, and bore thirty-
six llowers, spirally arranged upon a slender thread-like stalk. Specimens grown in our English hot-houses have produced flowerspikes of equal length, and with a much larger number of blossoms.

Flowers were scarce, as is usual in equatorial forests, and it was only at rare intervals that I met with anything striking. A few fine climbers were sometimes seen, especially a handsome erimson and yellow Eschynanthus, and a fine leguminous plant with clusters of large Cassialike flowers of a rich purple colour. Once I found a number of
 small Anonaceous trees of the genus Polyalthea, producing a most striking effect in the gloomy forest shades. They were about thirty feet high, and their slender trunks were covered with large star-like crimson Howers, which chustered over them like garlands, and jesembled sone artificial decoration more than a natural product. (See illustration, next page.)

The forests abound with gigantic trees with cylindrical buttressed, or

VANDA LOW:T. furrowed stems, while occasionally the traveller comes upon a wonderful figt-tree, whose trunk is itself a forest of stems and aïrial roots. Still more rarely are found trees which appear to have begun growing in
mid-air, and from the same point send out wide-spreading hranches above and a complicated pyramid of roots re-

scenling for seventy or eiglity feet to the ground below, nad so spreading on every side, that one can stand in the very centre with the irumk of the tree immedintely
overhead. Trees of this character are found all over the Archipelago, and the preceding illustration (taken from one which I often visited in the Aru Islands) will convey some idea of their general character. I believe that they originate as parasites, from seeds carried by birts and dropped in the fork of some lofty tree. Hence descend aërial roots, clasping and ultimately destroying the supporting tree, which is in time entirely replaced by the humble plant which was at first dependent upon it Thus we lave an actual struggle for life in the vergetable kingdom, not less fatal to the vanquished than the struggles among animals which we can so much more easily olserve and understand. The atvantage of quicker aceess to light and wamih and air, which is gained in one way by climbing plants, is here obtained by a forest tree, which has the means of starting in life at an elevation which others can only attain after many years of growth, and then only when the fall of some other tree has made room for them. Thus it is that in the warm and moist fond equable climate of the tropics, wach available station is seized upon, and becomes the means of developing new forms of lite especially adapited to occupy it.

On reaching sarawak early in Decenber I found there would not be an opportunity of returning to Siugapore till the latter end of Janmary. I therefore acequted Sir James Brooke's invitation to spend a week with him and Mr. St. John at lis cottage on leningauh. This is a very steep, pyranidal mountain of erystalline basaltic rock, about a thousand feet high, and covered with luxuriant forest. There are three Dyak villages upon it, and on a little phatform near the summit is the rude wooden lodge where the English Rajah was accustomed to go for relaxation and cool fresh air. It is only twenty miles up the river, but the road up the mountain is a succession of ladders on the face of precipices, bamboo bridges over grullies and chasms, and slippery paths over rocks and tree-trunks and huge boulders ats lig as houses. A cool spring under an overianging roek just below the cottage furnished us with refreshing laths and delicious drinking water, and the Dyaks brought us daily heaped-up baskets of Mangusteens and Lansats, two of the most delicious of the subacid
tropical fruits. We returned to Sarawak for Christmas (the second I had spent with Sir James Brooke), when all the Europeans both in the town and from the out-stations enjoyed the hospitality of the lajuh, who possessed in a pre-eminent degree the art of making every one around him comfortable and happy.

A few days afterwards I retumed to the momntain with Charles and a Malay boy named Ali and stayed there three weeks for the purpose of making a collection of land-shells, butterflies and moths, ferns and orchids. On the hill itself ferns were tolerably plentiful, and I made a collection of about forty species. But what occupied me most was the great abundanve of moths which on certain occasions I was able to capture. As during the whole of my eight years' wanderings in the Eist I never found another spot where these insects were at all plentilul, it will be interesting to state the exact conditions under which I here obtained them.

On one side of the cottage there was a verandah, looking down the whole side of the mountain and to its stmmit on the right, all densely clothed with forest. The boarded sides of the cottage were whitewashed, and the roof of the verandah was low, and also boarded and whitewashed. As soon as it got dark I placed my lamp on a table against the wall, and with pins, insect-forceps, net, and collecthur-boxes by my side, sat down with a book. Sometimes during the whole evening only one solitary moth would visit me, while on other nights they would pour in, in a continual stream, beeping me hard at work vatching and pimning till past midnight. They came literally by thousands. These good nights were very few. During the for weeks that I slent altogether on the hill I only had four really good nights, and these were always rainy, and the best of them suaking wet. But wet nights were not always good, for a rainy mounlight night produced next to nothing. All the chief tribes of moths were represented, and the beaty and variety of the species was very great. On groul nights I was able to capture from a hundred to two luudred and fifty moths, and these comprised on each occasion from half to twothirds that number of distinct species. Some of them
would settle on the wall, some on the table, while many would fly up to the roof and give me a chase all over the veraudah before I could secure them. In order to show the curious comnexion between the state of the weather and the degree in which moths were attracted to light, I add a list of my captures each night of my stay on the hill.

It thus appears that on twenty-six nights I collected 1,386 moths, but that more than 800 of them were collected on four very wet and dark nights. My success here led me to hope that, by similar arraugements, I might in every island be able to obtain abundance of these insects ; but. strange to say, during the six succeeding years I was
never once able to make any collections at nll approaching those at Saráwak. The reason of this I can pretty well understand to be owiug to the absence of some one or other essential condition that were here all combined. Sometimes the dry season was the hindrance; more frequently residence in a town or village not close to virgin forest, and surrounded by other houses whose lights were a counter-attraction; still more frequently residence in a dark palm-thatched house, with a lofty roof, in whose recesses every moth was lost the instant it entered. This last was the greatest drawback, and the real reason why I never again was able to meke a collection of moths; for 1 never afterwards lived in a solitary jungle-house with a low boarded and whitewashed verandah, so constructed as to prevent insects at once escaping into the upper 1 rart of the house, quite out of reach. Alter my long experience, my numerous failures, and my one success, I feel sure that if nuy party of naturalists ever make a yacht-voyage to explore the Malayan Archipelago, or auy other tropical region, making entomology one of their chief pursuits, it would well repay them to carry a small framed verandah, or a verandah-shaped tent of white cauvas, to set up in every favourable situation, as a means of making a collection of nocturnal Lepidoptera, and also of obtaining rave specimens of Coleoptera and other insects. I make the suggrestion here, because no one would suspect the enormous difference in results that such an apparatus would produce; and because I consider it one of the curiosities of a collector's experience to have found out that some such apparatus is required.

When I returned to Singapore I took with me the Malay lad named Ali, who sulsequently accompanied me all over the Archipelago. Charles Allen prelerred staying at the Mission-house, and afterwards oltained employment in Sariwak and in Singapore, till he again joinel me four years later at Amboyna in the Moluceas.

## CHAPTER VI.

## BOHNEO-THE DYAKS.

THE manners and customs of the aborigines of Borneo have been described in great detail, and with much fuller information than I possess, in the writings of Sir James Brooke, Messrs. Low, St. John, Johnson Brooke, and many others. I do not propose to go over the ground again, but shall confine myself to a sketch, from personal observation, of the general character of the Dyaks, and of such physical, moral, and social characteristics as have been less frequently noticed.

The Dyak is closely allied to the Malay, and more remotely to the Siamese, Chinese, and other Mongol races. All these are characterised by a reddish-brown or yellowishhrown skin of various shades, by jet-black straight hair, by the scanty or deficient beard, by the rather small and broad nose, and high cheekbones; !ut none of the Malayan races have the oblique eyes which are characteristic of the more typical Mongols. The average stature of the Dyaks is rather more than that of the Malays, while it is considerably under that of most Europeans. Their forms are well proportioned, their feet and hamds small, and they rarely or never attain the bulk of body so often seen in Malays and Chinese.

I am inclined to rank the Dyaks above the Malays in mental capacity, while in moral character they are undoubtedly superior to them. They are simple and honest, and become the prey of the Malay and Chinese traders, who cheat aud plunder them continually. They are more lively, more talkative, less secretive, and less suspicious than the Malay, and are therefore pleasanter companions. The Malay boys have little inclination for active sports and games, which form quite a feature in the life of the Dyak youths, who, besides outdoor games of skill and strength, possess a variety of indoor amusements. One wet day, in a Dyak house, when a number of boys and
young men were about me, I thought to amuse them with something new, and showed them how to make "cat's cradle" with a piece of string. Greatly to my surprise, they knew all about it, and more than I did; for, after I and Charles had gone through all the changes we could make, one of the boys took it off my hand, and made several new figures which quite puzzled me. They then showed ne a number of other tricks with pieces of string, which seemed a favourite amusement with them.

Even these apparently trifling matters may assist us to form a truer estimate of the Dyaks' character and social contition. We learn thereby, that these people have passed beyoud that first stage of savage life in which the struggle for existence absorbs the whole faculties, and in which every thonght and idea is connected with war or hunting, or the provision for their immediate necessities. These amusements indicate a cipability of civilization, an aptitude to enjoy other than mere sensual pleasures, which might be taken advantage of to elevate their whole intellectual and social life.

The moral character of the Dyaks is undoubtedly higha statement which will seem strange to those who have heard of them only as head-hunters and pirates. The Hill Dyaks of whom I am speaking, however, have never been pirates, since they never go near the sea; and head-hunting is a custom originating in the petty wars of vilhuge with village, and tribe with tribe, which no more inplies a bad moral character than did the custom of the slave-trade is humbed years ago imply want of general morality in all Who participated in it, Against this one stain on their character (which in the case of the Sariwak Dyaks no longer exists) we have to set many good points. They are truthful and honest to a remarkable degree. From this cause it is very often impossible to get from them any definite information, or even an opinion. They say, "If I were to tell yon what I don't know, I might tell a lir;" and whenever they voluntarily relate any matter of fact, yon may be sure they are speaking the truth. In a Dyak village the frut trees have each their owner, and it has ofteu happened to mo, on asking au inhabitant to gather we some fruit, to be answered, "I can't do that, for the
owner of the tree is not here;" never seeming to contemplate the possibility of acting otherwise. Neither will they take the smallest thing belonging to an European. When living at Simanjon, they continually eame to my house, and would pick up scraps of torn newspaper or crooked pins that I had thrown away, and ask as a great favour whether they might have them. Crimes of violence (other than head-hunting) are almost unknown; for in twelve years, under Sir James Brooke's rule, there hal been only one caso of nurder in a Dyak tribe, and that one was committed by a stranger who had been adopted into the tribe. In several other matters of morality they rank above most uncivilized, and even above many civilized nations. They are temperate in food and drink, and the gross sensuality of the Chinese and Malays is unknown among them. They have the usual fault of all prople in a half-savage state-apathy and dilatoriness; hut, lowever annoying this may be to Europeas who come in contact with them, it cannot be considered a very grave offence, or be held to outweigh their many excellent qualities.

During my residpuce among the Mill Dyaks, I was much struck by the apparent absence of those causes which are generally supposed to check the increase of population, although there were plain indications of stationary or but slowly increasing numbers. The conditions most favourable to a rapid increase of population are, un abundance of food, a healthy climate, and early marriages. Here these conditions all exist. The people produce far more food than they consume, and exchange the surplus for gotgs and brass camom, ancient jars, and gold and silver ornaments, which constitute their wealth. On the whole, they appear vory free from disease, marriages take place carly (but not too early), and ald bachelors and old maids are alike unknown. Why, then, we must iuquire, has not a greater population been produced? Why are the Dyak villages so small and so widely seattered, while nine-tenths of the country is still covered with forest?

Of all the checks to population among savage nations mentioned by Malthus-starvation, disease, war, infanticide, immorality, and infertility of the women-the last
is that which he seems to think least important, and of doultful efficacy; and yet it is the only one that seems to me capable of accounting for the state of the population among the Saradak Dyaks. The population of Great Britain increases so as to double itself in about fifty years. To do this it is evident that each married couple must average three children who live to be married at the age of about twenty-five. Add to these those who die in infancy, those who never marry, or those who marry late in life and have no offspring, the number of children born to each marriage must average four or five; and we know that families of seven or eight are very common, and of ten and twelve by no means rare. But from inquiries at almost every Dyak tribe I visited, I ascertained that the wormen rarely had more than three or four children, and an old chief assured me that he had never known a woman have more than seven. In a village consisting of a hundred and fifty familics, only one consisted of six children living, and only six of five children, the majority appearing to be two, three, or four. Comparing this with the known proportions in European countries, it is evident that the number of children to each marriage can hardly average more than three or four; and as even in civilized countries half the population die before the age of twentyfive, we should have only two left to replace their parents ; and so long as this state of things continued, the population must remain stationary. Of course this is a mere illustration; but the facts I have stated seem to indicate that something of the kind really takes place; and if so, there is no difficulty in understanding the smallness and almost stationary population of the Dyak tribes.

We have next to inquire what is the canse of the small number of births and of living children in a family. Climate and race may have something to do with this, but a more real and efficient cause seems to me to be the hard labour of the women, and the heavy weights they constantly carry. A Dyak woman generally spends the whole day in the field, and carties home every night a heavy load of vegetables and firewood, often for several miles, over rough and hilly paths; and not unlrequently has to climb up a rocky mountain by ladders, and over slippery stepping-
stones, to an eleratiou of a thousand feet. Besides this, she has an hour's work every evening to pound the rice with a heavy wooden stamper, which violently strains every part of the body. She begins this kind of labour when nine or ten years old, and it never ccases but with the extreme decrepitude of age. Surely we need not wonder at the limited number of her progeny, but rather be surprised at the successful eflorts of nature to prevent the extermination of the race.

One of the surest and most bencticial effects of andvancing civilization, will be the amelioration of the condition of these women. The precept and example of higher races will make the Dyak ashamed of his comparatively idle life, while his weaker partner labours like a beast of burthen. As his wants become increased and his tastes refined, the women will have more household duties to attend to, aud will then cease to labour in the field-a change which has already to a great extent taken place in the allied Malay, Javanese, and Bugis tribes. Population will then certainly increase more rapidly, improved systems of agriculture and some division of labour will become necessary in order to provide the means of existence, and a more complicated social state will take the place of the simple conditions of society which now obtain among them. But, with the sharper struggle for existence that will then occur, will the happiness of the people as a whole be increased or diminished? Will not evil passions be aroused by the spirit of competition, and crimes and vices, uow unknown or dormant, be called into active existence? These are problems that time alone can solve ; but it is to be hoped that elucation and at high-class European example may obviate much of the evil that too often arises in analogons cases, and that we may at length be able to point to one instance of an uncivilized people who have not become demoralized and finally exterminated, by contact with Earopean civilization.

A few words in conclusion, about the government of Sarawak. Sir James Brooke found the Dyaks oppressed and ground down by the most eruel tyranny. They were cheated by the Malay truders, and robbed by the Malay
chiefs. Their wives ant children were often captured and sold into slavery, and hostile tribes purelased permission from their cruel rulers to plumder, enslave, amd murder them. Anything like justice or redress for these injuries was utterly unattainable. From the time Sir James obtained prossession of the country, all this was stopped. Elual justice was awarded to Maday, Chinaman, and Dyak. The ranmseless rivates from the rivers farther cast were punishol, and finally shut up within their own territories, aud the Dyak, for the dirst time, cond sleep in peace. IIs wife and children were now sate from slavery; his honse was no longer burat over his head; his crops and his fruits were now his own, to sell or consume as he pheatend. And the maknown stranger who had done all this fon them, and asked fur mothing in return, what conld he be? How was it possible for them to realize his motives? Was it not uatural that they should refuse to helieve loe was at man? for of pure benevolence combined with great power, they had had mo experience amung nem. They maturally conclnded that he was a superior lieing cone down upan earth to comber blessings on the afflicted. In mary villages where he had not been seen, I was asked strange questions nbout him. Was he not as old as the mountains? Conld he not briug the dead to life? And they firmly believe that he can give them gool harvests, and make their fruit-trees bear an ahundant crop.

In forming a proper estimate of Sir James Brooke's government, it must ever be remembered that he held Sarawak solely by the goolwill of the native inhalitants. He had to deal witl two races, one of whon, the Mahometan Malays, looked upon the other race, the Dyaks, as savages and slaves, only fit to be wobled and plundered. He has effectually protected the Dyaks, and has invariably treated then as, in his sight, equal to the Malays; and yet he has secured the affection and grodwill of both. Notwithstanding the religious prejudices of Mahometans, he has induced them to modify many of their worst laws and customs, and to assimilate their crimiual code to that of the civilized world. That lis government still continues, after twenty-seven yearsnotwithstanding his frequent absences from ill-health,
notwithstanding conspiracies of Malay chiefs, and insurrections of Chinese gold-diggers, all of which have been overcome by the support of the native population, and notwithstanding financial, political, and domestic troubles -is due, I believe, solely to the many admirable qualities which Sir James Brooke possessed, and especially to his having convinced the mative population, by every action of his life, that he ruled them, not for his own advantage, but for their good.

Since these lines were written, his noble spirit has passed away. But though, by those who knew him not he may be sneered at as an enthusiast adventurer, or abused is a hard-harted despot, the universal testimony of every one who came in contact with him in his adopted country, whether European, Malay, or Dyak, will be, that Rajah lrooke was a great, a wise, and a good rulera true and faithful friend-a man to he admired for his talents, respected for his honesty and courage, and loved lor his genume hospitality, lis kimhess of disposition, and his tenderness of heart.

## CHATTER VII.

## JAVA.

ISPENT three montlis and a half in Java, from Juty 18 th to October 31 st , 1861, and shall brietly describe my own movements, and my observations on the people and the natural history of the country. To all those who wish to understand bow the Dutch now govern Java, and how it is that they are enabled to derive a lavge annual revenue from it, while the population increases, and the inlabitants are contented, I recommend the study of Mr. Money's excellent and interesting work, "How to Manage a Colony." The main facts and conclusions of that work I most heartily concur in, and I believe that the Tutch system is the very best that can be adopted, when.
a Earopean nation conquers or otherwise nequires possession of a comery inhalited by an industrious hut semibarbanous people. In my account of Northern Celebes, I shall show how successfully the same system has been applied to a people in a very different state of civilization from the Javanese; and in the meanwhite will state in the fewest words possible what that system is.

The mone of government now adopted in Tava is to retain the whole series of native rulers, from the village chief up to princes, who, under the name of Regents, are the heads of districts about the size of a small English? county. With each Rergent is placed a Dutch Resident, of Assistant Resident, who is considered to be his "elder brother," and whose "orlers" take the form of "recomnumbations," which are however implicitly obeyed. Along with each Assistant Resident is a Controller, a kind of inspector of all the lower native rulers, who periodically visits evory village in the district, examines the proceedings of the mative courts, hears complaints against the heud-men or other native chiefs, and superintends the Goverment plantations. This brings us to the "culture system," which is the souree of all the wealth the Dutch derive from. Java, and is the subject of muel abuse in this country because it is the reverse of "free trate." To understand its uses and heneficial elfects, it is necessary first to sketch the enmmon results of free European trade with uncivilized peoples.

Natives of tropical climates have few wants, and, when these are supplied, are disinclined to work for superthities without some strong incitement. With such a people the introduction of any new or systematic cultivation is almost impossible, except by the despotic orters of chiefs whom they have been accustomed to obey, as children obey their parents. The free competition of European traders, however, introduces two powerful imlacements to exertion. Spirits or opium is a temptation too strong for most savages to resist, and to obtain these he will sell whatever he has, and will work to get more. Another temptation he cannot resist, is goods on credit. The trader offers him gay cloths, knives, gongs, gums, and gunpowder, to be paid for by some crop perhaps not yet planted, or some proluct
yet in the forest. He has not sufficient forethonght to take only a moderate quantity, and not enough energy to work carly and late in order to get out of delit; and the consequence is that he aceumulates debt upon debt, and often remains for years, or for life, a debtor and almost a slave. This is a state of things which oceurs very largely in every part of the world in which men of a superior race freely trade with men of a lower race. It extenils trade no doubt for a time, but it demoralizes the mative, checks true civilization, and does not lead to any permanent increase in the wealth of the country; so that the European government of such a comery must be carried on at a loss.

The system introduced by the Dutch was to induce the people, through their chiefs, to give a portion of their time to the cultivation of coffee, sugar, and other valuable products. A fixed rate of wages-low indeed, but about equal to that of all places where European competition has not artificially raised it-was paid to the labourers engeged in clearing the ground and forming the plantations under Govermment superintendence. The produce is sold to the Govermment at a low fixed price. Out of the net profits a percentage goes to the chiefs, and the remainder is divided among the workmen. This surplus in good years is something considerable. On the whole, the poople are well fed and decently clothed; and have acquired habits of steady iadustry and the art of scientific cultivation, which must be of service to them in the future. It must be Fememberel, that the Government expended capital for years before any return was obtained; and if they now derive a large revenue, it is in a way which is far less burthensome, and far more beneficial to the people, than any tax that could be levied.

But itthough the system may be a good one, and as well adapted to the development of arts and industry in a half-civilized people, as it is to the material advantage of the governing country, it is not pretended that in practice it is perfectly carried out. The oppressive and servile relations between chiefs and people, which have continued for perhaps a thousand years, cannot be at once abolished; and some evil must result from those relations, till the spread of education and the gradual infusion of

European blood causes it naturally and insensibly to disappear. It is said that the Residents, desirous of showing a large increase in the products of their districts, have sometimes pressed the people to such continued labour on the plantations that their rice crops have been materially diminished, and famine has been the result. If this has happened, it is certainly not a common thing, and is to be set down to the abuse of the system, by the want of judgment or want of humanity in the Resident.

A tale has lately been written in Holland, and trans. lated into English, entitled "Max Iavelaar; or, the Coffee Auctions of the Dutch Trading Company," and with our usual one-sidedness in all relating to the Dutch Colonial System, this work has been excessively praised, both for its own merits, and for its supposed crushing exposure of the iniquities of the Dutch government of Java. Greatly to my surprise, I found it a very tedions and long-winded story, full of rambling digressions; and whose only point is to show that the Dutch Resideats and Assistant Residents wink at the extortions of the native princes; and that in some districts the natives have to do work without payment, and have their goods taken away from them without compensation. Every statement of this kind is thickly interspersed with italies and capital letters; but as the names are all fictitious, and neither dates, figures, nor details are ever given, it is impossible to verify or answer them. Even if not exagrerated, the facts stated are not nearly so had as those of the oppression by free-trade indigo-planters, and torturing by native tax-gatherers under British rule in India, with which the readers of English newspapers were familiar a lew years ago. Such oppression, however, is not fairly to be imputed in either case to the particular form of government, but is rather due to the infirmity of hmman nature, and to the impossibility of at once destroying all trace of ages of despotism on the one side, and of slavish obedience to their chiefs on the other.

It must be remembered, that the complete establishment of the Dutch power in Java is much more recent than that of our rule in Indin, and that there lave been several changes of government, and in the mode of raising revenue.

The inhabitants have been so recently under the rule of their native princes, that it is not easy at once to destroy the excessive reverence they feel for their old masters, or to diminish the oppressive exactions which the latter have always been aceustomed to make. There is, however, one grand test of the prosperity, and even of the happiness, of a community, which we can apply here-the rate of increase of the population.

It is universally almitted, that when a country increases rapidly in population, the people camnot be very greatly oppressed or very badly governed. The present system of raising a revenue by the cultivation of colfee and sugar, sold to Government at a fixed price, began in 1832. Just hefore this, in 1826, the pomulation by census was $5,500,000$, while at the beginniug of the century it was estinated at $3,500,000$. In 1850 , when the cultivation system had been in operation cighteen years, the population by census was over $9,500,000$, or an increase of 73 per cent. in twenty-four yeurs. At the last census, in 1865 , it amounted to $14,168,410$, an increase of very nearly 50 per cent. in fifteen years-a rate which would donhle the population in about twenty-six years. As Java (with Madura) contains about 38,500 geographical square miles, this will give an average of 368 persous to the squaro mile, just clouble that of the populons and fertile liengal Presidency as given in Thomton's Gazetteer of India, amd fully one-third more than that of Great Britain and Ireland at the last Census. If, as I believe, this vast population is on the whole contented and happy, the Dutch Government shonld consider well, before abruptly changing a system which has led to such great results.

Taking it as a whole, and surveying it from every point of yew, Java is probably the very finest and most interesting tropical island in the world. It is not first in size, lat it is more than 600 miles long, and from 60 to 120 miles wide, and in area is nearly equal th. Enogland; and it is undoubtedly the most fertile, the nost productive, and the most populous island within the thopies. Its whole surface is magnificently varied with nomonain and forest scenery. It possesses thinty-eight volcanic mountains, several of which rise to ten or twelve
thousand feet high. Some of these are in constant activity and one or other of them displays almost every phenomenon produced by the action of subterranean fires, except regular lava streams, which never occur in Java The abundant moisture and tropical heat of the climate causes these mountains to be clothed with luxuriant vegetation, often to their very sumnits, while forests and plantations cover their lower slopes. The animal productions, especially the birds and insects, are beautiful and varied, and present many preculiar forms found nowhere else upon the globe. The suil throughont the island is exreedingly fertile, and all the productions of the tropics. together with many of the temperate zones, can be casily cultivated. Java too 1 wisesses a civilization, a history and antiquities of its own, of great interest. The Sramminical religion Homrished in it from an epoch of unknown antiquity till about the year 1478, when that of Mahomet superseded it. The tormer religion was accompanied by a civilization which has not been equalled by the confuerors; for, scattered through the country, espeoially in the eastern part of it, are found buried in lofty forests, lemples, tombs, and statues of great beauty and gramdeur ; and the remains of extensive citios, where the tiger, the Hinoceros, and the with bulk now roam undisturbed. A modern civilization of another type is now spreading wer the land. Good roads run through the country from and to end; European and mative rulers work harmonionsly together; and life and property are as well secured as in the best groverned states of Entrope. I believe, therefore, that Jasa may fairly claim to be the finest tropical island in the world, and equally interesting to the tourist secking after new and beautiful scenes; to the naturalist who desires to examine the variety and beaty of tropical nature; or to the noralist and the politician who want to solve the problem of how man may be best governed under new and varied conditions.

The Dutch mail. steamer brought me from Ternate to Sourabaya, the chief town and port in the eastern part of Java, and after a fortnight spent in packing up and sending off my last collections, I started on a short journey into
the interior. Traveling in Java is very luxurious but very expensive, the only way being to hire or borrow a carriace, and then pay hall-a-crown a mile for post-horses, which are chauged at regular posts every six miles, and will cary you at the rate of ten miles an hour from one end of the island to the other. Bulloek carts or coolies are required to carry all extra baggage. As this kind of travelling would not suit my means, I determined on making only a short jommey to the district at the foot of Sount Arjuna, where I was told there were extensive forests, and where I hoped to be ahle to make some frood collections. The country for many miles behimi Sourabaya is perfectly flat and everywhere cultivated: being a delta or alluvial plain watered by many brathing streams. Immediately around the town the evident sign: of wealth and of an industrious pmplation weye very pleasing; but as we went on, the constant succession of open fields skirtell hy rows of hamboos, with here and there the white buildings and tall chimey of a sugar-mill, hecame monotonous. The ruals run in straight fines for several miles at a stretch, and are bordered by rows of dusty tamarimi-trees. At each mile there are little guardhonses, where a policeman is stationed; and there is a wooden rong, which by means of concerted signals may be made to cunvey information over the country with great rapidity. Alonit every six or seyen miles is the post-house, where the horses are changed as dunickly as were those of the mail in the ofd coaching days in Liugland.
I stopperl at Mondjokerto, a small town alout forty miles south of Somahay, and the marest proint on the high road to the district I wished to visit. I had a letter of introduction to Mr. Ball, an Englishman loug resident in Java and married to a Dutch lady, and le kindly invited me to stay with hin till 1 could tix on a place to suit me. A Dutch Assistant Resident as well as a Rerent or mative Javanese prince lived here. The town was neat, and had a nice open grassy space like a village green, on which stood a magnificent fig-tree (allied to the Banyan of India, but more lofty), under whose shade a kind of market is continually held, and where the inhabitants meet together to lounge and chat. The day after my artival, Mr. Bais
drove me over to the village of Modjo-agong, where he was building a house and premises for the tobaceo trade, which is carred on here by a system of native cultivation and advance purchase, somewhat similar to the indigo trade in Pritish India. On our way we stayed to look at a fratment of the ruins of the ancient city of Modjo-pahit, consisting of two lofty brick masses, apparently the sides of a

ANCISNT MAM-1:NALS.
gateway. The extrome perfection and beaty of the brickwork astonished me. The bricks are excectingly fine and hard, with sharp angles and true surfaces. They are laid with great exactness, without visible mortar or cement, yot somehow fastened together so that the joints are hardly perceptible, and sometimes the two surfaces conlesce in a most incomprelwasible manner. Such admirable brick-
work I have never seen before or since. There was no seulpture here, but abundance of bold projections and finely-worked mouldings. Traces of buildings exist for many miles in every direction, and almost every road and pathway shows a foundation of brickwork ienenth it-the paved roals of the old city. In the honse of the Waidono or district chief at Modjo-agong, I saw a beautiful figur carved in high relief out of a block of lava, and which had heen found buried in the ground near the village. On my expressing a wish to obtain some such specimen, Mr. B, nskel the chief for it, and much to my surprise he immedintely gave it me. It representel the Himbun goldess Durga, called in Jiva, Lora Jonergrang (the exalted virgin). She has eight arms, and stands on the back of a kneeling boll. Her lower right hand holds the tail of the bull, while the emrepmonding left hand grasps the hair of a eaptive, Dewth Mahikusor, the personifieation of vice, when has attempted to slay her lunll. He las a cond round his waist, and crouches at her fret in an attitule of suppiea tion. The other hands of the goddess hold, on letr right side, a double hook or small anchor, a limad straight swort, and a noose of thick corl; on her left, a girdle or armlet of large beads or shells, an unstrung how, and a standard ur war flag. This deity was a special favourite amons the oll Javanose, and her imase is oltem fimm in the ruined temples which abome in the eastern part of the island.
The specimen I had obtained was a srmall the, atome two fect high, weighing perhaps a humbedweight; and the next day we had it conveyed to Mooljo-kerto to await my return to Sourabaya. Having decided to stay some timn at Wonnsalem, on the lower slopes of the Arjuma Monntain, where I was informed I should find forest an! plenty of game, I had first to obtain a recommendation from the Assistant kesident to the Regent, and then :H order from the Regent to the Waidono ; and when after a week's delay I arrived with my barqage and men at Modjo-agong, I found them all in the midst of a five days' feast, to celebrate the circumcision of the Waidono's younger brother and consin, and had a small room in an outhonse given me to stay in. The courtyard and the
great open reception-shed were full of natives coming and going and making preparations for a feast which was to take place at midnight, to which I was invited, but preferred going to bed. A native band, or Gamelang, was playing almost all the evening, and I had a good opportunity of seeing the instruments and musicians. The former are chiefly gongs of various sizes, arrauged in sets of from eight to twelve, on low wooden frames. Each set is played by one performer with one or two drumsticks. There are also some very large gongs, played singly or in pairs, and taking the place of our drums and kettledrunis. Other instruments are formed by broad metallic bars, supported on strings stretched across frames; and others again of strips of bamboo similarly placed and producing the highest notes. Besides tlafse there were a flute and is curious two-stringed violin, repuiring in all twenty-four performers. There was a conductor, who led ofl and regnlated the time, and each performer took his part, coming in occasionally with a few bars so as to form a harmonious combination. The pieces played were long and complicated, and some of the players were mere hoys, who took their parts with great precision. The general effect was very pleasing, but, owing to the similarity of most of the instruments, more like a gigantic musieal hox than one of our hands; and in order to enjoy it thoroughly it is necessary to watch the large number of performers who are engaged in it. The next morning, while I was waiting for the men and horses who were to take me and my baggage to my destination, the two lads, who were about fourteen years old, were brought out, cluthed in a sarong from the waist downwards, and having the whole body covered with a yellow powder, and profusely decked with white blossoms in wreaths, necklaces, and armlets, looking at first siglit very like savage brides. They were conducted by two priests to a bench placed in front of the house in the open air, and the ceremony of circumcision was then performed before the assembled crowd.

The road to Wonosalem led through a maguificent forest. in the depths of which we passed a fine ruin of what appeared to have been a royal tomb or mausoleum. It is formed entirely of stone, and elaborately carver. Near
the base is a course of boldly projecting blocks, soulptured in high relief, with a series of scenes which are probably incidents in the life of the defunct. These are all beantifully executed, some of the figures of animals in particular being easily recognisable and very accumate. The general design, as far as the ruined state of the upper part will permit of its being seen, is very good, effect being given by an immense number and variety of projecting or retreating courses of squared stones in place of mouldings. The size of this structure is about thirty feet square by twenty high, and as the traveller comes suddenly upon it on a small elevation by the roatside, overshatowed by gigantic trees, overrun with plants and creepers, and closely backed by the glomy forest, he is struck by the solemnity and picturesque beauty of the scene, and is led to ponder on the strange law of progress, which looks so like retrogression, and which in so many distant parts of the worl has exterminated or driven out a highly artistid and constructive race, to make room for one which, as far as we can judge, is very far its inferior.

Few Englishmen are aware of the number and beaty of the architectural remains in Java. They have never been popularly illustrated or described, and it will therefore take most persons hy surprise to learn that they far surpass those of Contral America, perhaps even those of India. To give some idea of these ruins, and perchance to exeit. wealthy amateurs to explore them thoroughly and obtain hy photography an accurate recorl of their heautiful sculptures before it is too late, I will enumerate the most important, as briefly described in Sir Stamford Raffles' " History of Java."

Brambinam.-Near the centre of Java, between the native capitals of Djoko-kerta and Surakerta, is the village of Brambanam, near which are abundance of ruins, the most important being the temples of Loro-Jongran and Chandi Sewa. At Loro-Jongran them were twenty separate buildings, six large and fourteen small temples. They are now a mass of ruins, but the largest temples are supposed to have been ninety feet high. They were all constructed of solid stone, everywhere decorated with carvings and bas-reliefs, and adorned with numbers of statues.
many of which still remain entire. At Chandi Sewa, or the "Thousand Temples," are many fine colossal figures. Captain Baker, who surveyed these ruins, said he had never in his life seen "such stupendous and finished specimens of human labour, and of the science and taste of ages long since forgot, crowded together in so small a compass as in this spot." They cover a space of nearly six hudred feet square, amd consist of an outer row of eighty-four small temples, a second row of seventy-six, a third of sixty-four, a fourth of forty-four, and the fifth forming an inner parallelogram of twenty-eight, in all two humured and ninety-six small temples; disposed in five regular parallelograus. In the centre is a large cruciform temple surrounded by lofty flights of steps richly ornamented with sculpture, and containing many apartments. The tropical vegetation has ruined most of the smaller temples, but some remain tolerably perfect, from which the effect of the whole may be imagined.

About half a mile off is another temple, called Chanli Kali Bening, seventy-two feet square and sixty feet high, in very fine preservation, and covered with sculptures oi Hindoo mytholory surpassing any that exist in India. Other ruins of palaces, halls, and temples, with abundance of sculptured deities, are formd in the same neighhourhood.
Bormono.-About eighty miles westward, in the province of Kedu, is the great temple of Rorobodo. It is luilt upon a suall hill, and consists of a central dome and seven ranges of terraced walls covering the slope of the hill and forming open galleries cach below the other, and communicating by steps and gateways. The central dome is tifty fect in diameter ; around it is a triple circle of seventytwo towers, and the whole building is six hundred and twenty feet square, and about one hundred feet high. In the terrace walls are niches containing cross-legged figures larger tham life to the number of about four hundred, and both sides of all the terrace walls are covered-with basreliefs crowded with figures, and carved in hard stone; and which must therefore occupy an extent of nearly three miles in length! The amount of human labour and skill expended on the Great Pyramid of Egypt sinks into
insignificance when compared with that required to complete this sculptured hill-temple in the interior of Java.

Gunong Pruv.-About forty miles sonth-west of Smarang, on a mountain called Gunong I'rau, an extensive platean is covered with ruins. To reach these temples four flights of stone steps were made up the mountain from opposite directions, each tlight consisting of more than a housand steps. Traces of nearly four hundred temples have been found here, and many (perhaps all) were decorated with rich and delicate sedulpures. The whole comtry between this and Brambauan, a distance of sixty miles, almunds with ruins; so that fine sculptured images may be seen lying in the ditches, or built into the walls of enclosures.

In the eastern part of Jiana, at Kediri and in Malang, there are equally abumbint traces of antiquity, but the buillings thenselves have been mostly destryent. Sculptured tigures, however, abound; and the rains of forts, palaces, baths, ayueducts, and temples, can be everywhere traced. It is altogether contrary to the phat of this book to descrihe what I have not myself seen; but, haviag been bed to mention them, I felt bound to do something to call attention to these narvellous works of art. One is overwhelmet by the conterphation of these innumerable sealptures, worked with deliency and artistic feeling in a hard, intractable, trachytic rock, and all found in one tropical islaud. What could have been the state of society, what the amount of population, what the means of subsistence which rendered such gigantic works possible, will, perhaps, ever remain a mystery; and it is a wonderful example of the power of religious ideas in social life, that in the very country where, five hundred years ago, these grand works were being yearly executed, the inlabitauts now only build rude houses of hamboo and thateh, and look upon these relics of their furefathers with ignorant amazement, as the undoubted productions of giants or of demons. It is much to be regretted that the Dutch Government do not take vigorous steps for the preservation of these ruins from the destroying asency of tropical vegetation; and for the collection of the fine sculptures which are everywhere scattered over the laml.

Wonosalem is situated about a thousand feet above the sef, but unfortunately it is at a distance from the forest, and is surrounded by coffee-plantations, thickets of bamboo, and coarse grasses. It was too far to walk back daily to the forest, and in other directions I could find no collecting ground for insects. The place was, however, famous fror peacocks, and my boy soon shot seweral of these magnificent birds, whose llesh we found to be tender, white, and delicate, and similar to that of a turkey. The Java peacock is a different species from that of India, the neek being covered with scale-like green feathers, and the crest. of a different form ; but the eyed train is equally large ant erpually beautiful. It is a singular fact in geographical distribution that the peacock should not be found in Sunatra or Borneo, while the superb Argus, Fire-backed, and Ocellated pheasants of those islands are equally unknown in Java. Exactly parallel is the fact that in Ceylon and Southern India, where the peacock abounds, there are none of the splended Lophophori and other gorgeous: pheasants which inhabit Northern India. It would seem ans if the peacoek can admit of no rivals in its domain. Were these bipds rave in their native country, and noknown alive in Europe, they wonld assuredly be considered as the true princes of the featherel tribes, and altogether unrivalled for stateliness and beaty. As it is, I suppose scarcely any one if asked to fix upon the most beatiful bird in the world would name the peacock, any more than the I'apuan savage or the Bugis trader would fis upon the bird of paradise for the same honour.

Three days after my arrival at Wonosalem, my friend Mr. Ball came to pay me a visit. He told me that two evenings before, a boy had been killed and eaten by a tiger close to Modjo-agong. He was ridiug on a cart drawn by bullocks, and was coming home about dusk on the main road; and when not halt a mile from the village a tiger sprang upon him, carried him off into the jungle close by, and devoured him. Next moruing his remains were discovered, consisting only of a few mangled bones. The Waidono had got together about seven humdred men, and was in chase of the animal, which, I afterwards heard, they found and killed. They oniy use spears when in
pursuit of a tiger in this way. They surround a large tract of country, and draw gradually together till the animal is enclosed in a compact ring of armed men. When he sees there is no escape he generally makes a spring. and is received on a dozen spears, and almost instantly stabhed io death. The skin of an animal thus killed is, of course, worthless, and in this case the skull, which I had begred Mr. Ball to sceure for me, was hacked to pieces to divide the teeth, which are worn as charms.

After a week at Wonosalem, I retumed to the loot of the mountain, to a village naned Djapanman, which was surrounded by several patehes of forest, and seumed altoselher pretty well suited to my pursuits. The chicf of the village had prepared two small bambor rooms on nhe side of his own courtyard to accommondate me, and serned inclined to assist me as much as he could. The weather was excedingly hot and dey no min haviny thllen for several months, and there was, in consequence, a great seareity of insects, and especially of luetles. I therelore devoted myself chielly to obtaining atom set of the birds, and sueceded in making a tolerable collection. All the puacocks we had hithertu shot had hau short on imperfect tails, but I now ohtained two maynificent specjmens more than seven feet lone one of which I preserved antire, while 1 kept the train only atiached to the tail of two or theve others. When this bird is seen feeding on the gronnd, it appears womberful how it can rise into the air with such a lone and cmbersome train of feathers. It does so however with great ease, by rumning quickly for it short distance, and then rising oblopuely; and will Hy wor trees of a considerable height. I also obtained here a specinctu of the rare sreen jungle-fowl (Galhs furcatus), whase back and neek are beantifully scated with bronzy feathers, and whose smooth-edged oval comb is oi' a violet purple colour, changing to green at the base. It is also remarkable in possessing a single large watule beneath its throat, brighty coloured in three patehes of red, yellow, and blue. The common jungle-cock (Gallus bankiva) was also ubtained here. It is almost exactly like a common gamecock, but the voice is different, being much shorter and more abrupt; whence its native name is Bekeko. Six
different kinds of woodpeekers and four kingfishers were found here, the fine hornbill, Buceros lunatus, more than four feet long, and the pretty little lorikect, Loricnlas [msillus, scareely more than as many inches.

One morning, as I was preparing and arranging my specimens, I was told there was to he a trial; and presently four or five men came in and squatted down on a mat under the audienceshed in the court. The chief then came in with his clerk, and sat down opposite them. Lach spoke in turn, telling his own tale, and then I found out that those who first entered were the prisoner, accuser, policemen, and witness, and that the prisoner was indicated solely by having a loose piece of cord twined round his wriste, but not tied It was a case of rolbbery, and after the evidence was given, and a few questions had been asked by

 the chief, the accused said a few words, and then sentence was pronounced, which was a fine. The parties then got up and walked away torether, seeming quite friendly; and thronghout there was nothing in the mamer of any one present indicating passion or ill-feching-a very good iflustration of the Malayan type of claracter.

In a montl's collecting at Wonosalem and Djapannan

I acemmulated ninety-eight species of birks, but a most miserable lot of insects. I then determined to leave East Thea and try the more moist and luxmiant diatricts at the western extremity of the island. I returned to Sourabaya by water, in a rommy boat which bought myself, servants, atul bagrage at oue-filth the expense it had cost me to conne to Morljo-kevin. The river has heen reudered navigable by being carefnlly banked up, lut with the usual Whect of rendering the adjacent country liable necasionally to severe floods. An immense tatilic pasest down this river; and at a lock we passed thronch, a mile of laten hats were wating two or three deep, which pass through in their turn six at a time.

A few days afterwards I wont by stamer to Batavia, where I stayed about a week at the chiof hotel, white I made arrangements for a trip into the interion. The husinuss part of the city is near the harlour, hat the lontels and all the residences of the officials and Euronean merchants are in a sulnmb two miles ofi', laid out in wide streets and squares so as to cover a great extent of groumd. This is very inconvemient for visitors, as the only public converances are handsome two-horse carriages, whose lowest charge is five gruiluers (8s. td.) for hali a day, so that an hour's business in the moming and a visit in the evening costs $168,8 d$, at day for carriage hire alone.
latavia agrees very well with Mr. Money's graphe account of it, except that his "clear canals" were all muddy, and his "smootl gravel drives" up to the houses were one and all formed of coarse pebbles, very painful to walk upon, and hatly explained by the fact that in Batavia everyhody drives, as it can hardly be supposed that feople never walk in their gardens. The ILotel des Indes was very comfortable, each visitor having a sitting-room and lothoom opening on a verandah, where he can take his morning coffee and ifternoon tea. In the centre of the puadrangle is a building containing a number of marble liatls always ready for use; and there is an excellent bable dhote breatiast at ten, and dinuer at six, for all which there is a moderate charge per day.

I went by coach to Buitenzorg, forty miles inland and ahont a thousand feet above the sea. celebrated for its
delicious climate and its Botanical Gardens. With the latter [ was somewhat disappointed. The walks were all of loose pebbles, making any lengthened wanderings about then very tiring and painful under a tropical sun. The gardens are no doubt wouderfally rich in tropical and especially in Malayan plants, but there is a great absence of skilful laying-out; there are not enough men to keep the place thoroughly in order, and the plants themselves are seldom to be compared for luxurance and beauty to the same species grown in our hothouses. This can easily be explaized. The plants can rarely be placed in matural or very favourable conditions. The climate is either too hot or too cool, too moist or too dry, for a large proportion of them, and they seldon get the exact quantity of shade or the right quality of soil to stait them. In our stoves these varied conditions can be supplied to each individual plant far better than in a large garden, where the fact that the phants are most of them growiug in or near their mative comutry is supposed to prechule the necessity of giving them muth individual attention. Still, however, there is muth to admire here. There are avennes of stately pahms, and clumps of bamboos of perhaps fifty different kinds; and an endless variety of tropical shrubs and trees with strange and beautiful foliage. As a change from the excessive hents of Ihatavia, Butanzong is a delightful abode. It is just elevated enough to have delichusly cool evenings aud mights, but not so much as to require any change of clothing; and to a person long resident in the hotter climate of the plains, the air is always fresh and pleasant, and admits of walking at almost any hour of the day. The vicinity is most pieturesque and luxuriant, and the great volcano of GunungSalak, with its truncated and jagged summit, forms a chatacteristic background to many of the landseapes. A great mud eruption took place in 1690, sinee which date the mountain has been entirely inactive.

On leaving Buitenzorg, I had coolies to carty my baggage and a horse for myself, both to be changed every six or seven miles. The road rose gradually, and after the first stage the hills closed in a little on each side, forming a broad valley; and the temperature was so cool and
agrecable, and the country so interesting, that I preferred walking, Native villages imbedded in fruit trees, and pretty villas inhabited by planters or retired Dutch officials, gave this district a very pheasing and civilized aspect; lut what most attracted my attention was the system of terrace-cultivation, which is here universally adopted, and which is, I should think, havilly equalled in the world. The slopes of the main valley, and of its branches, were everywhere cut in terraces up to a considerable height, and when they wound round the recesses of the lills produced all the etlect of magnificent amphitheatres. Hundreds of square miles of country are thus terraced, and convey a striking idea of the industry of the people and the antiqnity of their civilization. These termes are extended year by year as the population increnses, by the inlabitants of each village working in concert under the direction of their chiets; and it is perhaps by this system of villute culture alone, that suth fxtensive teracimy and imgation has heen rondered pos sible. It was probally introntuced by the limatmins trom India, since in those Mahay conntites where thore is sun trace of a previous ocerpation by a civilized people, the terrace system is unknown. I first saw this monte of culfivation in Bali and Lomback, and, as I shall have to describe it in some detail there (see Chapter X.), I need say no mone about it in this phace, except that, owing to the find wulines and greater luxuriance of the country in Wust Java, it produces there the most striking and pieturespue elfect. The lower slopes of the mountains in Hava proseses sucla a tlelighful climate and luxuriant soil ; living is so cheap and life and property are so secure, that a consiterable number of Enropeans who have been engaged in Covernment service, settle permanently in the country instead of returning to Europe. They are seattered everywhe throughout the more accessible parts of the island, and tend greatly to the gradual improvement of the native population, aud to the continued peace and prosperity of the whole country.

Twenty miles beyond Tuitenzorg the post roal passes over the Megamendong Mountain, at an elevation of about. 4,500 feet. The country is finely mountainous, and there
is much virgin forest still left upon the hills, together with some of the ohlest coffee-plantations in Java, where the Ihants lave attained almost the dimensions of forest trees. About 500 feet below the summit level of the pass there is a road-ketper's hut, half of which F hired for a fortnight, as the country looked promising for making collections. I almost immeliately found that the productions of West

CAZLIPER BULTETHLY
Java were remarkably different from those of the castern part of the island; and that all the more remarkalle and characteristic Jawanese birds and insects were to be foumb here. On the very first day, my hunters obtained for me the elegant yellow and green trogon (Harpactes Reinwardti), the goryeous little minivet flycatcher (Pericrocotus miniatus), which looks like a flame of fire as it flutters among the lushes, and the rare and curious black and crimson oriole (Analcipus sancuinolentus), all of them species which are
found only in Java, and even seem to be confined to its western portion. In a week I obtained no less than twenty-four species of binds, which I had not fourd in the east of the island, and in a fortnight this number increased to forty species, almost all of which are peculiar to the Javanese fama. Large aml handsome butterflics were also tolerably abundant. In dark ravines, and occasionally on the roadsite, I eaptured the superb Papilio arjun, whose wings seem powdered with grains of golden green, condensed into bands and moon-shaped spots; while the elegantly-formed Papilio coön was sometimes to be found fluttering slowly along the shady pathways (see figure at page 129). One day a boy brought ne a butterlly between his fingers, perfectly unhurt. He had caught it as it was sitting with wings erect, sucking up the liguid from a muddy spot by the roadside. Mauy of the finest tropical butterflies have this habit, and they are generally so intent upon their meal that they can be easily ab proached and captured. It proved to be the rave and curious Charaxes kadenii, remarkable for having on each hind wing two curved tails like a pair of callipers. It was the only specimen I ever saw, and is still the only representative of its kind in English collections.

In the east of Java I had suffered from the intense heat and drought of the dry season, which had been very inimical to insect life. Here I had got into the other extreme of damp, wet, and cloudy weather, which was equally unfavourable. During the montl which I spent in the interior of West Java, I never had a really hot fine lay throughout. It rained almost every afternoon, or derse mists came down from the mountains, which equally stopped collecting, and rendered it most difficult to dry my specimens, so that I really had no chance of getting a fair sample of Javanese entomology.

By far the most interesting incident in my visit to Java was a trip to the summit of the Pangerango and Gedel mountains; the former an extinct volcanic cone abont 10,000 feet high, the latter an active crater on a lower portion of the same mountain range. Tchipanas, about four miles over the Megamendong Pass, is at the foot of the mountain. A small country house for the Governor-

General and a manch of the Botanic Gardens are situated here, the keeper of which accommodated me with a bel for a night. There are many beautiful trees and shrubs planted lere, and large quantities of Europen vegetables are grown for the Governor-General's table. By the side of a little torrent that bordered the garden, quantities of orchids were cultivated, attached to the trunks of trees, or suspended from the branches, forming an interesting openair orchid-house. As I intended to stay two or tharee nights on the monutain I engaged two coolies to carry my baggage, and with my two lanters we started early the next morning. The first mile was over open country, which brought us to the forest that corers the whole mountain from in height of about 5,000 feet. The next mile or two was a tolerably steep ascent through a grand virgin forest, the trees being of great size, and the undergrowth consisting of fine herbaceous plants, trec-ferns, and shrubby vegretation. I was struck by the immense number of ferns that grew by the side of the road. Their variety seemed endless, and I was continually stopping to admire some new and interesting forms. I could now well understand what I had been told by the gardener, that 300 species had been found on this one mountain. $\Lambda$ little before noun we reached the small platenu of Tjiburong at the foot of the steeper part of the mountain, where there is a plank-house for the acemmodation of thavellers. Close by is a picturesque waterfall and a curious cavern, which I had not time to explore. Continuing our ascent the road became narrow, rugged and steep, winding zigzag up the cone, which is covered with irregular masses of rock, and overgrown with a dense luxuriant but less lofty vegetation. We passed a torrent of water which is not much lower than the boiling point, and has a most singular appearance as it foams over its rugged bed, seading up clouds of steam, and often concealed by the overhanging herbage of ferns and lycopodia, which here thrive with more luxuriance than elsewhere.

At about 7,500 feet we came to another hut of open bamboos, at a place called Kandang Badak, or "Rhinocerosfield," which we were going to make our temporary abode. Here was a small clearing, with abundance of tree-ferns
and some young plantations of Cinchona. As there was now a thick mist and drizaling rain, I did not attempt to go on to the summit that evening, but made two visits to it during my stay, as well as one to the active crater of Gedch. This is a rast semicircular chasm, bounded by black perpendicular walls of rock, and surrounded by miles of rugged scoriacovered slopes. The crater itself is not very deep. It exlibits patches of sulphur and variously-coloured volcanic products, and emits from several vents continual streams of smoke and vapour. The extinct cone of Panstrango was to me more interesting. The summit is an irregnlar undulating plain with a low bordering ridge, and one deep lateral chasm. Unfortunately there was perpetunl mist and rain either above or below us all the time I was on the mountain; so that I never once saw the plain below, or had a glimpse of the magnificent vipw which in fine weather is to be obtained from its summit. Notwithstanding this drawback I enjoyed the excursion exceedingly, for it was the first time I had been hich enough on a mountain near the Equator to watch the change from a tropienl to a temnerate flora. I will now briefly sketch these clanges as I observed them in Java.

On ascending the mountain, we first meet with tonperate forms of herbaceous plants, so low as 3,000 fect, where strawberries and violets begin to grow, but the former are tasteless, and the latter have very small and wale flowers. Weedy Composite also begin to give a European aspect to the wayside herbage. It is between 2,000 and 5,000 feet that the forests and ravines exhibit the utmost development of tropical luxuriance and beauty. The abundance of noble Tree-ferns, sometimes fifty feet high, contributes greatly to the general effect, since of all the forms of tropical vergetation they are certainly the most striking and beautiful. Some of the deep ravines which have been cleared of large timber are full of them from top to bottom ; and where the road crosses one of these valleys, the view of their feathery crowns, in varied positions above and below the eye, offers a spectacle of picturesque benuty never to be forgotten. The splendid foliage of the broad-leaved Musacee and Zingiberacee, with their curious and brilliant flowers ; and the elegant and
varied forms of plants allied to Begonia and Melastoma, continually attract the attention in this region. Filling up the spaces between the trees and larger plants, on every trunk and stump and branch, are hosts of Orchids, Ferns and Lycopods, which wave and hang and intertwine in ever-varying complexity. At about 5,000 feet I first saw horsetails (Equisetum), very like our own species. At 6,000 feet, Raspberries abound, and thence to the summit of the mountain there are three species of eatable Rubus. At 7,000 feet Cypresses appear, and the forest trees become reduced in size, and more covered with mosses and lichens. From this point upward these rapidly increase, so that the blocks of rock and scoria that form the mountain slope are completely hidden in a mossy vegetation. At about 8,000 feet European forms of plants become abundant. Several species of Honey-suckle, St. John's-wort, and Guelder-rose abound, and at about 9,000 feet we first meet

TEUYULA JMPERIALIR with the rare and beautiful Royal Cowslip (Primula imperialis), which is said to be found nowhere else in the world but on this solitary mountain summit. It has a tall, stout stem, some-
times more than three feet high, the root leaves are cighteen inches long, and it bears several whorls of cowslip-like tlowers, instead of a terminal cluster only. The forest trees, gnarled and dwarfed to the dimensions of bushes, reach up to the very rim of the old crater, but do not extend over the hollow on its summit. Here we find a good deal of ofen ground, with thickets of shrubby Artemisias and Gnaphaliums, like our southernwood and cudweed, but six or eight feet high ; while Buttereups, Violets, Whortleberries, Sow-thistles, Chickweed, white and yellow Crucifere, Plantain, and annual grasses everywhere abound. Where there are bushes and shrubs, the St, Xoln's-wort and IIoncysuckle grow abundantly, while the Imperial Cowslip only exhilits its elegant blossoms under the damp shade of the thickets.

Mr. Motley, who visited the mountain in the dry seasom, and paid much attention to botany, gives the following list of genera characterstic of distant and more temperate regions:-Two species of Violet, three of Ranunculus, three of Impatiens, eight or ten of Rubus, and species of Primula, Hypericum, Swertia, Convallaria (Lily of the Valley), Vaccinium (Cranberry), Ruododendron, Gnaphalium, Polysonum, Digitalis (Foxglove), Lonicera (Honeysuckle), Plantago (Rib-grass), Artemisia (Wormwood), Lobelia, Oxalis (Wood-sorre)), Quercus (Oak), and Taxus (Yew). A few of the smaller plants (Plantago major aud lanceolata, Sonchus oleraceus, and Artemisia vulgaris) are identical with European species.

The fact of a vegetation so closely allied to that of Europe occurring on isolated mountain peaks, in an island south of the Equator, while all the lowlands for thousands of miles around are occupied by a flora of a totally different character, is very extraordinary; and has only recently received an intelligible explanation. The Penk of Teneriffe, which rises to a greater height and is much nearer to Europe, contains no such Alpine flora; neither do the mountains of Bowbon and Mauritius. The case of the volcanic peaks of Java is therefore somewhat exceptional, but there are several analogous, if not exactly parallel cases, that will enable us better to understand in what way the phenomena may possibly have been
brought about. The higher peaks of the Alps and even of the Pyrences, contain a number of plants absolutely identical with those of Lapland, but nowhere found in the intervening plaius. On the summit of the White Mountains, in the United States, every flant is identical with species growing in Labrador. In these cases all ordinary means of transport fail. Most of the plants have heavy seeds, which could not possibly be carried such immense distances by the wind; and the ageney of birds in so effectually stocking these Alpine heights is equally out of the question. The difficulty was so great, that some naturalists were driven to believe that these species were all separately ereated twice over on these distant peaks. The determimation of a recent ghacial epoch, however, soon oflered a much more satisfactory solution, and one that is now universally accepted by men of science. At this period, when the mountains of Wales were full of ghaciers, and the mountainous parts of Central Europe, and much of America north of the qreat lakes, were covered with snow and ice, and had a climate resembling that of Labrador and Greenland at the present day, an Arctic flora covered all these regions. As this eproch of cold passed away, and the snowy mantle of the country, with the glaciers that descended from every mountain summit, receled up their slopes and towards the north pole, the plants receded nlso, always clinging as now to the margins of the perpetual snow line. Thus it is that the same species are now found on the summits of the mountains of temperate Europe and America, and in the barren north-polar regions.

But there is another set of facts, which help us on another step towards the case of the Javanese mountain flora. On the higher slopes of the Himalaya, on the tojes of the mountains of Central India and of Abyssinia, a number of plants occur which, though not identical with those of European mountains, belong to the same genera, and are sail by botanists to represent them; and most of these could not exist in the warm intervening plains. Mr. Darwin believes that this class of facts can be explained in the same way; for, during the greatest severity of the glacial epoch, temperate forms of plants will have
extended to the confines of the tropies, and on its departure, will have retreated up these soutlem mountains, as well as northward to the plains and hills of Europe. But in this case, the time elapsed, and the great change of conditions, have allowed many of these plants to becone so modified that we now consider them to be distinct species. A variety of other facts of a similar nature, have led him to believe that the depression of temperature was at one time sufficient to allow a few nortly-temperate plants to cross the Equator (by the most elerated routes) and to reach the Antarctic regions, where they are now found. The evidence on which this belief rests, will the fiand in the latter part of Chapter II. of the "Origin of Species;" and, accepting it for the present as an bypothesis, it enables us to account for the presence of a flom of European type on the volcanoes of Java.

It will, however, naturally be objected that there is a wile expanse of sea between Java and the continent, which would have effectually prevented the immigration of temperate forms of plants during the glacial epoch. This woukd undoubtedly be a fatal objection, were there not abundant evilence to show that Java has been formerly comected with Asia, and that the union mast have ocemred at ahout the epoch required. The most striking proof of such a junction is, that the great Mammalia of Java, the rhmoceros, the theres, and the Banterg or wild ox, oceur also in Sian and liumah, and these would eertainly not have been introluced by man. The Javanese peacock and several other hinds are also conmon to these two enuntries; but, in the majority of cases, the species are thistinct, thongh closely allied, indicating that a considerable time (required for such modification) has elapsed since the separation, while it has not leen so long ns to cause an entire change. Now this exatily colresponds with the time we shouhd require since the temperate forms of plants entered Jova. These are alnost all now distinct species; but the changed conditions noter which ther are now forced to exist, and the probability of some of them having since died out on the continent of India, sufficicutly accounts for the Javanese species being different.

In my more special pursuits, I had very little success upon the mountain; owing, perhaps, to the excessively unpropitious weather and the shortness of my stay. At from 7,000 to 8,000 feet elevation, I obtained one of the most lovely of the small fruit pigeons (Ptilonopus roseicollis), whose entire head and neck are of an exquisite rosy pink colour, contrasting finely with its otherwise green plumage; and on the very summit, feeding on the ground among the strawberries that have been planted there, I obtained a dull-coloured thrush, with the form and habits of a starling (Turdus fumidus). Insects were almost entirely absent, owing no doubt to the extreme dampness, and I did not get a single butterfly the whole trip; yet I feel sure that, during the dry season, a week's residence on this mountain would well repay the collector in every department of natural history.

After my return to Toego, I endeavoured to find another locality to collect in, and removed to a coffec-plantation some miles to the north, and tried in succession higher and lower stations on the mountain; but I never succeeded in obtaining insects in any abundance, and birds were far less plentiful than on the Megamendong Mountain. The weather now became more rainy than ever, and as the wet season seemed to have set in in carnest, I returned to Batavia, packed up and sent off my collections, and left by steamer on November 1st for Banca and Sumatra.

## CHAPTER VIII.

## sumatra.

(FOVEMben 1861 TO JANUAIY 1862. )
TCHE mail steamer from Batavia to Singapore took me to Muntok (or as on English maps, "Minto"), the chiel town and port of Banca. Here I stayed a day or two, till I could obtain a boat to take me across the straits, and up the river to Palembang. A few walks into the country
showed me that it was very hilly, and full of granitic and laterite bocks, with a dry and stunted forest vegetation; and I could find very tew insects. A good-sized open sailing-hoat took me across to the mouth of the Palembang river, where at a fishing village, a rowing-boat was hired to take me up to Palembang, a distance of nearly a hundred miles by water. Except when the wind was strong and favourable we could only proceed with the tide, and the banks of the river were generally flooded Nipa-swamps, so that the hours we were obliged to lay at anchor passed very heavily. Reaching Palembang on the 8th of November, I was lodged by the Doctor, to whom I had brought a letter of introduction, and endeavoured to ascertain where I could find a good locality for collecting. Every one assureal me that I should have to go a very long way further to find any dry forest, for at this season the whole country for many miles inland was flooded. I therefore had to stay a week at Palembang before I could deternine on my future movements.

The city is a large one, extending for three or four miles along a fine curve of the river, which is as wide as the Thames at Greenwich. The stream is, however, much narowed by the houses which project into it upon piles, and within these, again, there is a row of houses built upon great bumboo rafts, which are moored by rattan cables to the shore or to piles, and rise and fall with the tide. The whole river-front on both sides is chietly formed of such houses, and they are mostly shops open to the water, and only raised a foot above it, so that by taking a small boat it is easy to go to market and purchase anything that is to be lad in lolembang. The natives are true Malays, never building a house on dyy land if they can find water to set it in, and never going anywhere on foot if they can reach the place in a boat. A considerable portion of the population are Chinese and Arabs, who carry on all the trale; while the only Europeans are the civil and military oflicials of the Dutch Govemment. The town is situated at the head of the delta of the river, and between it and the sea there is very little ground elevated above highwater mark; while for many miles further inland, the banks of the main stream and its numerous tributaries are
swampy, and in the wet season flooded for a considerable distance. Palembang is built on a patch of elevated ground, a few miles in extent, on the north bank of the river. At a spot about three miles from the town this xises into a little hill, the top of which is held sacred by the natives, and is shaded by some fine trees, inhabited by a colony of squirrels, which have become half tame. On holding out a lew ermmbs of bread or any fruit, they come running down the trunk, take the morsel out of your fingers, and dart away instantly. Their tails are carried erect, and the hair, which is ringed with grey, yellow, and brown, radiates uniformly around them, and looks exceedingly pretty. They have somewhat of the motions of mice, coming on with little starts, and gazing intently with their large black eyes, before venturing to advance further. The manner in which Malays often obtain the confidence of wild animals is a very pleasing trait in their character, and is due in some degree to the quiet deliberation of their manuers, and their love of repose rather than of action. The young are obedient to the wishes of their elders, and seem to feel none of that propensity to mischief which European boys exhibit. How long would tame squirrels continue to inhabit trees in the vicinity of an English village, even if close to the church ? They would soon be pelted and driven away, or snared and confined in a whirling cage. I have never heard of these pretty animals being tamed in this way in England, but I should think it might be easily done in any gentleman's park, and they would certainly be as pleasing and attractive as they would be uncommon.

After many inquiries, I found that a day's journey by water above Palembang there commenced a military road, which extended up to the mountains and even across to Bencoolen, and I determined to take this route and travel on till I found some tolerable collecting ground. By this means I should secure dry land and a gool road, and avoid the rivers, which at this season are very tedious to ascend owing to the powerful currents, and very unproductive to the collector owing to most of the lands in their vicinity being under water. Leaving early in the morning we did not reach Lorok, the village where the road begins, till
late at night. I stayed there a few days, but found that almost all the ground in the vicinity not under water was cultivated, and that the only forest was in swamps which were now inaccessible. The only bird new to me which I obtained at Lorok was the fine long-tailed parroquet (Paleornis longicauda). The peophe lere assured me that the country was just the same as this for a very long way -more than a week's journey, and they seemed hardly to have any conception of an elevated forest-clad country, so that I began to think it would be useless going on, as the time at my dispusal was too short to make it worth my while to spend much more of it in moving about. At length, however, I fouml a man who knew the country. and was more intelligent; and he at once told me that if I wanted forest I must go to the district of Rembang, which I fouml on inquiry was about twenty-five or thirty miles off.

The road is divided into regular stages, of ten or twelve miles each, and, without sending on in advance to have coolies ready, only this distance can be travelled in a day. At each station there are houses for the accommodation of passengers, with cooking-house and stables, and six or eight men always on guard. There is an established system for coolies at fixed rates, the inhabitants of the surrounding villages all taking their turn to be subject to coolie service, as well as that of guards at the station for five days at a time. This arrangement makes travelling very easy, and was a great convenicnce for me. I had a pleasant walk of ten or twelve miles in the morning, and the rest of the day could stroll about and explore the village and neighbourlood, having a house ready to occupy without any formalities whatever. In three days I reached Moera-dua, the first village in Tembang, and finding the country dry and undulating, with a grood sprinkling of forest, I determined to remain a short tine and try the neighbourhool. Just opposite the station was a small but deep river, and a grood bathing-place; and beyond the village was a fine patch of forest, through which the road passed, overshalowed by magnificent trees, which partly tempted me to stay; but after a fortnight I could find no good place for insects, and very few birls
different from the common species of Malacea. I therefore moved on another stage to Loho Raman, where the guard-house is situated quite by itself in the forest, nearly a mile from ench of three villages. This was very agreeable to me, as I could move about without having every motion watched by erowds of men women and children, and I had also a much greater variety of walks to each of the villages and the phantations around them.

The villares of the Sumatran Malays are somewhat peculiar and very picturesque. A space of some acres is surrounded with a high fence, and over this area the houses are thickly strewn withont the least attempt at regularity, Tall cocoa-nut trees grow abundantly between them, and

the ground is bare and smootl with the trampling of many feet. The houses are raised about six feet on posts, the best being entirely built of planks, others of bamboo. The former are always more or less omamented with carving, and have high-piteled roofs and overhanging eaves. The gable ends and all the chief posts and beams are sometimes covered with exceedingly tasteful carved work, and this is still more the case in the district of Menangkabo, further west. The floor is made of split banboo, and is
rather shacy, and there is no sign of anything we should call funiture. There are no benches or chairs or stools, but merely the level floor covered with mats, on which the inmates sit or lie. The aspect of the village itself is very neat, the ground being often swept before the chice houses; but very bad odours alound, owing to there being under uvery house a stinkiug mud-hole, formed by all waste liquids ani refuse matter, ponred duwn through the floor above. In most other things Malays are tolerably cleanin some scrupulously so; and this peculiar and nasty custom, which is ahost miversal, arises, I have little dould, from their laving been originally a maritime and water-loving people, who built their houses on posts in the water, and only migrated gradually inland, first up the rivers and streams, and then into the dry interior. Habits which were at once so convenient and so cleauly, and which had leen so long practised as to become a portion of the domestic life of the nation, were of course continued when the first settiers built their houses inland; and without a regular system of drainage, the arragement of the villages is such, that any other system would be very inconvenient.

In all these Sumatran villages I found considerable dificulty in getting anything to eat. It was not the season for vegetables, and when, after much trouble, I managed to procure some yams of a curious variety, I found them hard and scarcely eatable. Fowls were very searce; and fruit was reduced to one of the poorest kinds of banama, The natives (during the wet season at least) live exclusively on rice, as the poorer Irish do on potatoes. A pot of rice cooked very dry and eaten with salt and rel peppers, twice a day, forms their entire food during a large part of the year. This is no sign of poverty, but is simply custom; for their wives and cbildren are loaded with silver armlets from wrist to elbow, and carry dozens of silver coins strung round their neeks or suspended from their ears.

As I had moved away from Palembang, I had found the Malay spoken by the common people less and less pure, till at length it became quite unintelligible, although the continual recurrence of many well-known words assured
me it was is form of Malay, and enabled me to guess at the main subject of comversation. This district had a very bad reputation a few years ago, and travellers were frequently robbed and murdered. Fights between village and village were also of frequent oceurence, and many Lives were lost, owing to disputes about boundaries or intrigues with women. Now, however, since the country has been divided into districts under "Controlleurs," who visit every village in turn to hear complaints and settle rlisputes, such things are no more heard of. This is one of The numerous examples I have met with of the good eflects of the Dutch Government. It exercises a strict surveillance over its most distant possessions, establishes a form of government well adapted to the character of the people, reforms abuses, punishes crimes, and makes itself everywhere respected by the native population.

Lubo Raman is a central point of the east end of sumatra, being about a hundred and twenty miles from the sea to the east, north, and west. The surface is undulating, with no mountains or even hills, and there is no rock, the soil being generally a red friable clay. Numbers of small streams and rivers intersect the country, and it is pretty equally divided between open clearings and patclies of forest, both virgin and second growth, with abundance of fruit trees; and there is no lack of paths to get about in any direction. Altogether it is the very country that would promise most for a naturalist, and I feel sure that at a more favomable time of year it would prove exceedingly rich; but it was now the rainy season, when, in the very best of localities, insects are always scarce, and there being no fruit on the trees there was also a scarcity of birds. During a month's collecting, I added only three or four new species to my list of birds, although I obtained very fine specimens of many which were rare and interesting. In butterflies I was rather more successful, obtaining several fine species quite new to me, and a considerable number of very rare and beautiful insects. I will give here some account of two species of butterflies, which, though very common in collections, present us with peculiarities of the highest interest.

The first is the handsome Papilio memnon, a splendid butterfly of a deep black colour, dotted over with lines and groups of seales of a clear ashy blue. Its wings are five inches in expanse, and the hind wings are rounded, with scalloped edges. This applies to the males; but the females are very different, and vary so much that they were once supposed to form several distinct species. They may be sivided into two groups-those which resemble the male us shape and those which differ entirely from him in the

outline of the wings. The first vary much in colour, being often nearly white with dusky yellow and red markiugs, but such differences often occur in butterflies. The second group are much more extraordinary, and would never be supposed to be the same insect, since the hind wings are lengthened out into large spoon-shaped tails, no
rudiment of which is ever to he perceived in the males or in the orlinary form of females. These tailed females are never of the dark and blut-glossed tints which prevail in the male and often occur in the females of the same limm. but are invariably ornamented with stripes and patches of white or buff, ocenpying the larger part of the surface of the hind wings. This peculiarity of colouring led mee th discover that this extrandinary fenalo closely resembles (when Hying) another butterfly of the smme grenus but of a different gronp (Papilio comn); and that we have here a

case of minicry similar to those so well jllustrated and explatined lay Mr. Bates. ${ }^{1}$ That the resemblance is not accidental is safticiently proved by the finct, that in the North of India, where Papilio coon is rephemed by an allied form (Papilio Doubledayi) having red spots in $1^{\text {dace }}$ of yellow, a closely-allied species or varjety of I'apilio memnon ( P . androgeus), has the tailed femate also red spottel. The use and reason of this resemblance arpeats to be, that the butterffies imitated belong to a section of the genus Papilio which from some canse or other are not attacked by birks, and by so chosely resembling these in form and colour the female of Memon and its ally, also

[^3]escrpe perscention. Two other species of this same section P'aphiountiphus amb l'apilio pulyphontes) are so closely imitated by two female coms of lapilio thesens (which enmes in the same section with Memmon), that they completely deenved the Duteh entomologist. De llaan, and he acordingly classed them as the same sporins!
lhat the most curious fact enmected witl these tistinct firms is, that they are both the oflspring of either form. A single brood of larra were bred in Java ly a Duteh chtomologist, and produced males as wedt ats tailed and tailless females, and there is every reason to believe that this is always the case, and that furms intermediate in character never oceur. 'lo illustrate these phenomena, let us stupose a roaning Englishman in some remote island to have two wives-one a black-baived red-skimed Indian, the other a woolly-headed sooty-skinned negress; and that instead of the children being mulatoes of brown or "lusky tints, mingling the characteristics of each parent in tarying degrees, all the boys should be as fair-skimen and blue-cyed as their father, while the girls should altogether resemble their mothers. This would be thought strange enough, but the case of these butterflies is yet more extraordinary, for each mother is capable not only of producing male olfsping like the father, and female like herself, but also other females like her fellow wife, and altogether differing from herself:

The other species to whicly I have to direct attention is the Kallima paralekta, a butterlly of the same family group as our Purple Emperor, and of about the same size or larger. Its upper surface is of a rich purple, variously tinged with ash colour, and across the fore wings there is a brond bar of deep orange, so that when on the wing it is very conspicuous. This species was not uncontmon in dry woods and thickets, and I olten endeavoured to capture it without success, for after flying a short distance it would enter a bush among dry or dead leaves, and however carefully I crept up to the spot I could never discover it till it would suddenly start out again and then disappear in a similar place. At length I was fortunate cnough to see the exact spot where the buttertly settled, and though I lost sight of it for some time, I at length discovered that it
was close hefore my eyes, but that in its pasition of repose it so closely resembled a dead leaf atfached to a twig as almost certainly to deceive tho eye evon when gazing full

upon it. I maptured suberal specimens on the wing, and was able fully to understand the way in which this wonderful resemblance is produced.

The end of the upper wings terminates in a fine point, just as the leaves of many tropical shrubs and trees are pointed, while the lower wings are someWhat more obtuse, and are lengthened out into a short thick tail. Between these two points there runs a dark curved line exactly representing the midrib of a leaf, and from this radiate on each side a few oblique marks which well imitate the lateral veins. These marks are more clearly seen on the outer portion of the base of the wings. and on the inner side towards the middle and apex, and they are produced by strie and markings which are very common in allied species, but which are here modified and strengthened so as to imitate more exactly the venation of a leat. The tint of the under surface varius much, but it is always some ashy brown or reddish colour, which matches with those of dead leaves. The habit of the species is always to rest on a twig and among dead or dry leaves, anil in this position with the wings closely pressed together, their outline is exactly that of a mode-rately-sized leaf, slightly curved ar shrivelled. The tail of the hind wings forms a perfect stalk, and touches the stick while the insect is supported by the middle pair of legs, which are not noticed rmong the twigs and fibres that surround it. The head and antenne are drawn back between the wings so as to be quite concealed, and there is a little notch hollowed out at the very base of the wings, which allows the head to be retracted sufficiently. All these varied details combine to produce a disgnise that is so complete and marvellous as to nstonish every one who observes it; and the hahits of the insects are such as to utiliza all these peculiarities, and render them available in such a manner as to remove all doubt of the purpose of this singular case of mimicry, which is undoubtedly a protection to the insect. Its strong and swift flight is sufficient to save it from its enemies when on the wing, but if it were equally conspicuous when at rest it could not long escape extinction, owing to the attacks of the insectivorous birds and reptiles that alonnd in the tropical forests. A very closely allied species, Kallima intachis, inhabits India, where it is very common, and specimens are sent in every collection from the

Himnlayas. On examining a number of these, it will be seen that no two are alike, but all the variations correspond to those of dead leaves. Exery tint of yellow, ash, brown, and red is found here, and in many specimens there oceur patches and spots formed of small black dots, so closely resembling the way in which minute fungi grow on leaves that it is almost impossible at first nut to believe that fungi have grown on the butterflies themselves!

If such an extraordinary adaptation as this stood alone, it would be very difticult to ofler any explanation of it ; hut although it is perhaps the most perfect case of protective initation known, there are hundreds of similar resemblances in nature, and from these it is possible to deduce a general theory of the manner in which they have been slowly brought about. The principle of variation and that of " natural selection," or survival of the tittest, as elaborated by Mr. Darwin in his celebrated "Origin of Species," offers the foudation for such a theory; and I have myself endeavoured to aply it to all the chief cases of imitation in an article published in the Westminster Reviev for 1867, entitled "Mimicry, and other Protective Resemblances anong Animals," to which any reader is referred who wishes to know more about this subject.

In Sumatra, monkeys are very ahmolant, and at Lobo Raman they used to frequent the trees which overhaug the graddiouse, and give me a line opportunity of ohserving their gambols. Two species of Smmopithecus were most plentiful-monks of a slender form, with very long tails. Not being much shot at they are rather bold, and remain quite unconcerned when natives alone are present; but when I eame out to look at them, they would stare for a minute or two and then make off. They take tremendous leaps from the branches of one tree to those of another a little lower, and it is very amusiug when one strong leader takes a bohd jump, to see the others fullowing with more or less trepilation ; and it often happens that one or two of the last seem quite unable to make up their minds to leap till the rest are disappearing, when, as if in desperation at being left alone, they throw themselves frantically into the air, and often gro crashing through the sleuder branches and fall to the ground.

A very curions ape, the Sianatug, was also mather obumbant, but it is much less bold than the monkeys, kecping to the virgin forests and avoiling villages. This species is allied to the little long-armed apes of the gemus llylobates, but is considerably larger, and differs from them by having the two first fingers of the feet united together, nearly to the end, whence its Latin mane, Siamanga syndactyla It moves much nore slowly than the active IIylobates, keeping lower down in trees, and not indulging in such tremendons leaps; but it is still very active, and by means of its immense long atms, five feet six inches across in an adult about three feet ligh, can swing itself along anong the trees at a creat rate. I purchased a small one, which had been causht by the natives and tied up so tightly as to lurt it. It was rather savage at first, and trien to bite; but when we had released it and given it wo polus moder the vemodah to lang upou, secuming it by a slome cond, ruming along the pole with a xing, so that it could move easily, it became more contented, and woulal swing itself about with great rapidity. It ate almost any lind of fruit and rice, and I was in hopes to have brought it tu Emgland, but it died just before I started. It took a dislike to me at first, which I tried to get over by feeding it constanty myself". One day, however, it hit me so shar, ly while giving it food, that I lost patience and gave it rather a severe beating, which I regretted afterwards, as from that time it, dislikel me more than ever. It wonld allow ny Malay boys to play with it, and for hours together wonld swing by its arms from pole to pole and on to the ratlers of the vembdah, with so much ease and rapidity, that it was a constant source of amusement to us. When I returned to Singapore it attracted great attention, as no one had seen a Siammg alive before, although it is not uncommon in some parts of the Malay peniusula.

As the Orang-utan is known to inhabit Sumatra, and was in fact first diseovered there, I made many inquiries about it; but mone of the matives hat ever head of sheh an animal, nor could I find any of the I Hutch oflicials who knew anything about it. We may conclude, theretore, that it cloes not inhabit the great forest plains in the east ot Sumatra where one would naturally expect to find it, but
is probably confined to a limited region in the north-westa part of the island entirely in the hands of native rulers. The other great Mammalia of Sumatra, the elephant and the rhinoceros, are more widely distributel ; but the former is much more scaree than it was a few yenrs ago, and seems to retire rapidly before the spread of cultivation. About Lobo Raman tusks and bones are occasionally found in the forest, but the living animal is now never seen. The rhinoceros (Rhinoceros sumatranns) still abounds, and I continually saw its tracks aml its dung, and once disturbed one feeding, which went crashing away through the jurgle, only permittiug me a momentary glimpse of it through the dense underwood. I oltained a tolerably perfect cranium, and a number of teeth, which were picked up by the natives.

Another curious animal, which I had met with in Singapore and in Borneo, but whieh was more abuulant here, is the Galeopithecus, or tlying lemur. This creature has a broad membrane extending all round its boly to the extremities of the tues, and to the point of the rather long tail. This emables it to pass obliquely through the air from one tree to auother. It is sluggish in its motions, at least by day, going up a tree by slort runs of a few feet, aud then stopping a moment as if the action was difticult. It rests during the day clinging to the trunks of trees, where its olive or brown fur, mottled with irregular whitish spots and botches, resembles closely the colour of mottled bark, and no doubt helps to protect it. Once, in a bright twilight, I saw one of these animals run up a trunk in a rather ofen phace, and then glide obliquely through the air to another tree, on which it alighted near its base, and immediately began to ascend. I paced the distance from the one tree to the ohher, and found it to be seventy yards; and the amount of descent 1 estimated at not more than thirty-five or forty feet, or loss than one in five. This I think proves that the animal must have some power of graing itself through the air, otherwise in so long a distance it would have little chate of alighting exactly mon the trunk. Like the (usens of the Moluceas, the Gateopithecus feeds chiefly on laves, and possesses a very roluminous stomach ind lon ${ }^{4}$ convoluted intestines. The
brain is very small, and the animal possesses shch remarkable tenueily of lile, that it is excemdinsly diffent to kill it by any ordinary means. The tail is prehensile, and is

probklily made nze of as an additional support white feed ing. It is satid to lave only a simgle yung one at a time, aud my uwn observation confirms this statement, for I
once shot a female, with a very small blind aud naked little creature clinging closely to its breast, which was quite bare and much wrinkled, reminding me of the young of Marsupials, to which it seemer to form a transition. On the back, and extending over the limbs and mombrane, the fur of these animals is short, but expuisitely solt, resembling in its texture that of the Chinchilla

I returned to Palembang by water, and while staying a day at a village while a boat was being made watertight, I had the good fortune to obtain a male, female, and youms bind of one of the large hombills. I had sent my hunters to shoot, and while I was at breakfinst they returned, bringing me a fine large male, of the Buceros bicornis, which one of them assured me he had shot while feeding the female, which was shut up in a hole in a tree. I had often read of this curions habit, and immediately returned to the place, accompanied by severtl of the natives. Alter grossing a stream and a bog, we found a large tree leaning over some water, and ou its lower side, at a height of about twenty feet, appeared a small hole, and what looked like a quantity of mul, which I was assured had been used in stopping up the larede hole. After a while we heard the larsh ory of a bird inside, and could see the white extremity of its beak put out. I offered in rupee to any one who would ro up and get out the birt, with the erer or yomer one: but they all dechared it was too diffientt, and they were afraid to try. I therefore very reluctantly came away. In about an hour afterwards, much to my suprise, a tremendons loud hoarse screaming was heard, and the bid was brought me, together with a young one which had been found in the hole. This was in most curious object, as large as a pigeon, hut without a particle of plumage on any part of it. It was exceedingly plump and solt, and with a semi-transparent skin, sis that it looked more like a bag of jelly, with head and feet stuck on, than like a real bird.

The extraordinary babit of the male, in plastering up the fomale with her egg, and feeding her during the whole time of incubation, and till the young one is fledged, is common to several of the large hornbills, and is one of those strange facts in uatural history which are " stranger than fiction."

## CHAPTER IX.

SATULAL HBSORY OF THE INDO-MALAY ISLANDS.

IN the first chapter of this work I have stated genemally the rasons which lead us to conclude that the large slands in the western portion of the Archipelago-Java, Sumatra, and Bonneo-as well as the Malay penimsula and the Plilippine islands, have been reeently separated from the contiment of Asia. I now propose to give a sketch of the Natural History of these, which I tem the Indo-Malay islands, and to shaw how fiar it supports this view, mai how much information it is able to give us of the antiquity and origin of the separate islands.

The flura of the Archipelago is at present so imperfectly known, and I have myself paid so little attention to it, that I cannot draw from it many facts of importance. The Malayan type of vergetation is however a very inportant whe ; and [hr. Honker intoms us, in his "Flora lndica," that it spreads over all the moister and more equable parts of India, and that many plants foumd in Ceylon, the Himalayas, the Nilghini, and Khasia monntains are identical with those of Java and the Malay peninsula. Among the more characteristic forms of this flora are the rattans-climbing palms of the genus Calamus, and a great sariety of tall, ns well as stemless palms. Orchids, Aracea, Zingiberacew, and ferns are especially abundant, and the genus Gramma-tophyllam-a gigantic epiphytal orchis, whose clusters of leaves and flowr-stems are ten or twelve feet long-is peculiar to it. Here, too, is the domain of the wonderful pitcher plants (Nepenthacese), which are ouly representerl elsewhere by solitary species in Ceylon, Madagascar, the Seychelles, Celebes, and the Moluccas. Those celebrated fruts, the Mangosteen and the Iourian, are natives of this region, and will hardly grow out of the Archipelago. The mountain phats of Java have already been alluded to as ghowing a former connexion with the continent of Asin; and a still more extramdinary and more ancient connexion
with Australia has been indicated by Mr. Low's collections fron the summit of Kini-balou, the loftiest mountain in Borneo

Plants have much meater facilities for passing across arms of the sea than amimals. The lighter seeds are easily carried hy the winds, and many of them are specially adapted to lue so carriod. Others can float a long time

unhurt in the water, and are drifted by winds and currents to distant shores. ligeons, and other fruit-eating limds, are also the means of distributing phants, since the sects readily areminute after passing though their bodies, It thas happers that phants which grow on shores and lowlands have a whle distribution, and it requires an extensive knowlende of the species of each ishand to determine the relations of their doras with any approwh to acenracy. At present we have no such complite bnowlelge of the botary
of the several islands of the Archipelago ; and it is only by such striking phenomena as the occurrence of northern and even Europeau genera on the summits of the Javanese mountains that we can prove the fommer connexion of that island with the Asiatic continent. With land animals, however, the case is very different. Their means of passing a wide expanse of sea are far more restricted. Tincir distribution has been more accurately studied, and we possess a much more complete knowledge of such groups as summals and birds in most of the ishands, than we do of the plants. It is these two classes which will supply us with most of our facts as to the geographical distribution of oxganized beings in this region.

The number of Mammalia known to inlabit the InloMalay region is very considerable, exceeding 170 species. With the exception of the bats, none of these have any regular means of passing arms of the sea many miles in extent, and a consideration of their distribution must therefore greatly assist us in detemining, whether these islants have ever been connected with each other or with the continent since the epoch of existing species.

The Quadrumana or monkey tribe form one of the most characteristic features of this region. Twenty-four distinct species are known to inhabit it, and these are distributed with tolerable uniformity over the islands, nine leing found in Java, teu in the Malay peniusula, eleven in Sumatra, and thirteen in Borneo. The great man-like Orang-utans are found only in Sumatra and Borneo; the curious Siamang (next to them in size) in Sumatra and Malacea; the long-nosed monkey only in Bonno ; while every island has representatives of the Gibbons or longamed apes, and of nonkeys. The lemur-like animals, Nyeticebus, Tarsius, and Graleopithecus, are found in all the islands.

Seven species found on the Malay peninsula extend alse into Sumatra, four into Borneo, and three into Java; while two range into Siam and Burmah, and one into North India. With the exception of the Orang-utan, the Siamang, the Tarsins spectrum, and the Galeopithecus, all the Malaynn genera of Quadrumana are represented in India by closely allied species, although,
owing to the limited rauge of most of these animals, so few are absolutely identical.

Of Carnivora, thinty-three species are known from the Indo-Malay region, of which about eight are found also in Burnah and India. Among these are the tiger, leonnal, a tiger-cat, civet, and otter; while ont of the twenty genera of Malayan Carnivora, thirteen are represented in India by more or fose closely alliwd species. As an example, the curions Malayn glutton (Iflictis orientalis) is whesented in Northern India by a closely allied species Helictis nipalensis.

The houfed animals are twenty-two in number, of which about seven extind into Burmah and India. All the deer are of poculiar species, except two, which range from Malacea into India. Of the cattle, one Lnilian spectes reaches Manacen, while the lios sondaicus of Java amb Borneo is also found in Siam and Buruath. A goat-like minal is foum in Sumatra which has its represeutative in India; while the two-homed rhinoceros of Sumatra and the single-horned species of Java, lone supposed to loe preuliar to these islands, are now hoth ascertained to rxist in Lurmah, P'egu, aud Monlmein. The clephant of Sumatra, Bomeo, and Malacea is now considered to be ilentical with that of Ceylon and India.

In all other groups of Mammalia the same general phenomena recur. A fow species are identical with those of India. A much larger number are elosely allied or representative forms; while there are always a small number of peculiar genera, consisting of animals unlike those found in any other part of the worlt. There are nbout fifty bats, of which less than one-fourth are lnutians species; thirby-four Rodents (squirtels, rats, \&e.), of which six or eight only are Indian ; and ten Insectivora, with one exception pectiar to the Malay region. The squirrels are very abundant and characteristic, only two species out of twenty-five extending into Sian and Lumah. The Thpaias are curious insect-eaters, which closely resemhle squirrels, and are almost contined to the Malay ishands, as are the small feather-tailed l'tilocerus lowii of Bornco, and the curious long-snouted and naked-tailed Gymmurus ralthesii.

As the Malay peninsula is a part of the continent of Asia, the question of the former union of the islands to the mainland will be bust elucidated hy studying the species which are fomm in the formor listriet, and also in some of the islands. Now, if we entirely leave ont of consideration the hats, which lave the power of thinht, there are still forty-eight species of mammals commoti to thee Malay feninsula and the three lave ishands. Among these are seven (Gundruman (apes, monkeys, and lenuas), animals who pass their whole existence in forests, who mer swiu, and who would be quite unable to traverse a single mile of sea; nineteen Carnivora, sone of which no domht might cruss by swimming, but we cannot suppose so large a mumber to lave passed in this way across a stail which, except at one paint, is from thirty to fifty miles wite : imd tive hoofed ammals, incholing the Tapir, two species of rhinoceros, and an elephant. Besides thase there are thirtees Rodents and four Insectivona, including a shrew. thouse and six squirrels, whose maided passige over twenty miles of sea is even mone insonceivable than that of the larger animals.

But when we come to the cases of the same species inhabiting two of the more widely separated islands, the diltienty is much increased. Borneo is distant nearly 150 miles from Piliton, whieh is about fifty miles from Tanea, and this filteen from Sumatra, yet there are no less than thirty-six suecies of mammals common to Bornco and sumatra. Java ngain is more than 250 miles from Borneo, yet these two islands have twenty-two species in common, including monkeys, lemurs, wihl oxen, squirels. and shrews. These facts seem to render it absolutely cortain that there las been at some former period a connexion hotween all these islauds and the main land, and the fact that most of the animals common to two or more of them show little or no variation, but are ofteu absolutely identical, indicates that the separation must have been recent in a geological sense ; that is, not eadier than the Newer Miocene epoch, at which time laud awimals began to assimilate closely with those now existing.

Even the bats furnish an additional argument, if one were needed, to show that the islands could not have been
peopled from each other and from the continent without some former connexion. For if such had been the mode of stocking them with animals, it is quite erertain that creatures which ean lly long distances would be the first to spread from island to islaud, and thus produce an almost perfect uniformity of species over the whole region. But no such unformity existe, and the bats of each island are alunst, if not quite, as distinct as the other mammals. For example, sixteen species are known in lorneo, and of these ten are found in Tava and five in Sumatra, a proportion alount the same as that of the Rodents, which have no direet means of migration. We learn from this fact, that the seas which separate the is?ands from each other are wide enough to prevent the passage even of flying aumals, and that we must look to the same causes as having led to the present distribution of both groups. The only sufficient canse we can imagise is the former connexion of all the islands with the continent, and such a change is in perfect hamony with what we know of the carth's past history, and is rendered probable by the remarkable fact that a rise of only three hundred feet would convert the wide seas that separate them into an inmense winding valley or plain ahout three hundred miles wide and twelve hundred long.

It may, perlaps, he thought that birds which possess the power of flight in so pre-minent a degree, would mat be limited in their range by arms of the sea, and would thus afford few indications of the former union or separation of the islands they inhabit. This, however, is not the case. A very large number of birls appear to be as strictly limited by watery barriers as are quadrupeds ; and as they have been so much more attentively collected, we have more complete materials to work upon, and are enabled to deduce from them still more definite and satisfactory results. Some groups, however, such as the aquatic birds, the waders, and the birds of prey, are great wanderers; other groups are little known except to ornithologists. I shall therefore refer chiefly to a few of the best known and most remarkable families of birds, as a sample of the conclusions furnished by the entire class.

The birds of the Indo-Malay region have a close resemblance to those of Tndia; for though a very large proportion
of the species are quite distinet, there are only about fifteen peculiar genera, and not a single family group confined to the former district. If, however, we compare the islands with the Burmese, Siamese, and Malayan countries, we shall find still less difference, and shall be convinced that ath are closely united by the boud of a former union. In such well-known families as the woolpeckers parrots, trogons, barbets, kingfishers, pigeons, and pheasants, we fini some identical species spreading over all India, and as far as Jiva and Borneo, while a very large proportion are common to Sumatra and the Malay peninsula

The force of these facts can only lee appreciated when we come to treat of the islands of the Austro-Malas region, and show how similar barriers have entirely preventel the passare of hirls from one islamd to amother. so that out of at least three hundred and fifty land birdinhahiting Jawa and borneo, not more than ten have passed eastward into Celebes. Yet the Straits of Macassar are not nearly so wide as the Java sea, and at least a lundral species are common to Borneo nud Java.

I will now give two examples to show how a knowlelge of the distribution of amimals may reveal unsuspeeted facts in the past history of the earth. At the eastern extremity of Sumatra, and separated from it by a strait about fifteen miles wide, is the small rocky island of Danca, celelrated for its tin mines. One of the Dutch residents there sent some collections of birds and animals to Leyden, and among them were found several species listinct from those of the aljacent coast of Sumatra. One of these was a squirrel (Sciurus bangkanus), closely allied to three other species inhabiting respectively the Malay peniusuha, Sumatra, anl Domeo, but quite as distinet from them all as they are from each other. There were also two new ground thrushes of the genus litta, closely allied to, but cuite distinct from, two other species inhabiting both Sunatran and Borneo, and which did not perceptibly differ in these large and wilely separated islands. This is just as if the Isle of Man possessed a peenliar species of thrush and blackbird, distinct from the birds which are common to England and Ireland.
These curions facts would indieate that Banca may heve
existed as a distinct ishand even longer than Sumatra and Bormeo, and there are some geological and grographical facts which render this not so mprobable as it would at first scem to be. Although on the map Banca appears so close to Sumatra, this does not arise from its having been recently separated from it; for the adjacent district of Palembang is new land, heing a great alluvial swamp formed by torrents from the montains a hundred miles distant. Banca, on the other hand. agrees with Malacea, Singapore, and the intervening island of Lingen, in being formed of granite and laterite; and these have all most likely once formed an extrmsion of the Malay peninsula. As the rivers of Bmmen and Sumatra have been for ages filling up the intersening sea, we may he sure that its depth has recently been greater, and it is very probable that those large islands were never directly connceted with each other except through the Malay peninsula. At that period the same species of squirrel and Pita may have juhabited all these countries; but when the subterranean disturbances occurred which led to the elevation of the volcanoes of Sumatra, the small island of Banca may have been serarated first, and its productions being thus isolated might be gradually modified before the separation of the larger islands hat been completed. As the southern part of Sumatra extended eastwarl and formed the narrow straits of Banca, many birds and insects and some Mammalia would cross from one to the other, and thus produce a general similarity of productions, while a few of the older inhabitants remained, to reveal by their distinct forms their different origin. Unless we suppose some such changes in physical geography to have occurred, the presence of peculiar species of birds and mammals in such an island as Banca is a hopeless puzzle; and I think I have shown that the changes reyuired are by no means so improbable as a mere glance at the map would lead us to suppose.

For our next example let us take the great islands of Sumatra and Java. These approach so closely together, and the chain of volcanoes that runs through then gives such an air of unity to the two, that the idea of thatir having been recently dissevered is immediately suggested. The natives of Java, however, go further than this; for
they actually have a tradition of the eatastrophe which broke them asumeler, and fix its date at not much more than a thousand years ago. It becomes interesting, therefore, to see what support is given to this view by the comparison of their animal prodactions.

The Mammalia have not been collected with suflicient completeness in both islands to make a general comparison of much value, and so many species have been ohtained mily as live specmens in captivity, that tleir locality bas often been erroneonsly given,-the island in which they were obtained heing substituted for that from which they originally cane. Taking into consideration only those whose distribution is more accurately known, we learn that Sumatra is, in a zoologieal sense, more nearly related to Borneo than it is to Java. The great man-like apes, the elephant, the topir, and the Malay bear, are all common to the two former countries, while they are alsent from the latter. Of the three long-tailed monkeys (Semnopitheeus) inhabiting Sumatra, one extends into Bumeo, but the two spectes of Jata are both peeuliar to it, So also the great Malay deer (Lusin equina), ind the small Tragulas kanchil, are common to Sumatra and Borneo, Lut do not extend into Java, where they are rephaced by Tragulus javanicus. The tinet, it is true, is found in Sumatra and Java, but not in Borneo. Rut as this animal is known to swim well, it may have found its way aeross the Straits of Sunda, or it may have inlabited Java belore it was separated from the main land, and from some unknown cause have ceased to exist in Borneo.

In Ornithology there is a little uncertainty owing to the hirds of Java and Sumatra being much better known than those of Borneo; but the ancient separation of Java as an island, is well exhibited by the large number of its species which are not found in any of the other islands. In possesses no less than seven pigeons peculiar to itself, while Sumatra has only one. Of its two parrots one extends into lorneo, but neither into Sumatra. Of the fitteen species of woodpeckers inhabiting Sumatra only four reach Java, while eight of them are found in Bornco and twelve in the Malay peninsula. The two Trogons found in Java are peculiar to it, while of those inhabiting Sumatra at
least two extend to Malacea and one to Bornco. There are a very large number of birds, such as the great Argus pheasant, the fire-backed and ocellated pheasants, the crested partridge (Rollulus coronatus), the small Malacea parrot (Psittinus incertus), the great helmeted hornbill (Buceroturus galeatus), the pheasant ground-cuckoo (Carborecyx rahintus), the rose-crested bee-eater (Nyetiomis amieta), the great gaper (Corydon sumatrams), and the green-crested gaper (Calyptomena viridis), and many others, which are common to Malatea, Sumatra, and Borneo, but are entircly abrent from Java. On the othrer hand we have the peacock, the green juugle cock, two blue mround thrushes Artensa cyanes and Myophonus flavirostris), the fine pink-healed love (litonopus porphyreus), three brond-tailed ground pigeons (Macropygia), and many other interesting birds, which are found nowhere in the Archipelago out of Java.

Insects furmish us with similar facts wherever sufficient Jata are to be had, but owing to the abundant collections that have been made in Java, an ufair preponderance maty he given to that island. This does not, however, seem to le the case with the trte lapilionida or swallow-tailed hutterflies, whose large size and gorgeous colouring has led to their being collected more frequently than other insects. Twenty-seven species are known from Java, twenty-nine from Bomeo, and only twenty-oue from Sumatra. Four are entirely contined to Java, while only two are peculiar to Borneo and one to Sumatra. The isolation of Java will, however, be best shown by grouping the islands in pairs, and indicating the number of species common to each pair. Thus:-

Making some allowance for our imperfect knowledge of the Sumatran species, we see that Java is more isolated from the two larger islands than they are from each other: thus entirely confirming the results given by the distri-
i. 2
bution of birds and Mammalia, and rendering it almost certain that the last-named island was the first to be completely separatel from the Asiatic continent, and that the native tradition of its haviug been recently separated from Sumatra is entirely without foundation.

We are now enabled to trace out with some probability the course of events. Beginning at the time when the whole of the Java sea, the Gulf of Siam, and the Straits of Malacea were diy land, forming with Borner, Sumatra, and Jaya, a vast southern prolongation of tie Asiatic continent, the first movement would he the sinking down of the Java sea, and the Straits of Sunda, consequent on the activity of the Javanese volcanoes alony the southern extremity of the land, and lading to the complete separation of that island. As the volcanic belt of Java and Sumatra increased in activity, more and more of the land was submerged, till first Bonneo, and afterwards Sumatra, became entirely severed. Since the epoch of the first disturbace, several distinct elerations and depressions may have taken place, and the islands may lave been more than once joined with each other or with the main land, and again separated. Successive waves of immigtattion may thus have modified their animal productions, and led to those anomalies in distribution which are so difficult to account for by any single operation of elevation or submergence. The form of Borneo, consisting of radiating mountain chains with intervening broad alluvial valleys, suggests the idea that it has once been much more submerged than it is at present (when it would have somewhat resembled Celebes or Gilolo in outline), and has been increased to its present dimensions by the filling up of its gulfs with sedimentary matter, assisted by gradual elevation of the land. Sumatra has also been evidently much increased in size by the formation of alluvial plains along its north-eastern coasts.

There is one peculiarity in the productions of Java that is very puzzling-the occurrence of several species or gromps characteristic of the Siamese countrits or of India, but which do not occur in Bornco or Sumatra. Among Mammals the Rhinoceros javanicus is the most striking example, for a distinet species is found in Bornco and

Sumatra, while the Javanese apecies occurs in Birmah and even in Bengal. Among burds, the small ground dove, Geopelia striata, and the curious bronze-coloured magpie, Grypsirhina varians, are common to Java and Siam; while there are in Java species of Pteruthins, Arrenga, Myiophonus, Zoothera, Sturnopastor, and Fstrelda, the nearest allies of which are found in various parts of India, while nothing like them is known to inhabit Borneo or Sumatra.

Such a curions phenomenon as this can only be understood, by supposing that, subsequent to the separation of Java, Bornco became almost entirely submeryed, and om its re-elevation was for a time connected with the Malay peninsula and Sumatra, but not with Java or Siam. Any geologist who knows how strata have been contorted and tilted up, and how elevations and depressions must often have occurred alternately, not once or twice only, lut scores and even hundreds of times, will have no difiiculty in admitting that such changes as have been here indiented are not in themselves improbable. The existence of extensive coal-beds in Borneo and Sumatra, ol such recent origin that the leaves which abound in their shales are scarcely distinguishable from those of the forests which now coser the country, proves that such changes of level actually did take place; and it is a matter of much interest, both to the geologist and to the philosophic naturalist, to he able to form some conception of the order of those changes, and to understand how they may have resulted in the actual distribution of animal life in these countries;-a distribution which often presents phenomena 80 strange and contradictory, that without taking such changes into consideration we are unable even to imagine how they could have been brought about.

## CHAPTER X.

## BAJI AND LOMBOCK.

\{UNE, sULY, 1856.)

TIIE islands of Bali and Lombock, situated at the cast end of Java, are particularly interesting. They are the only islands of the whole Archipelago in which the Hindoo religion still maintains itself-and they form the extreme points of the two great zoological divisions of the Lastem hemisphere; for although so similar in extemal appearance and in all physical features, they differ greatly in their natural produetions. It was after laving spent two years in Borneo, Malacea and Singapore, that 1 made a somewhat involuntary visit to these ishonds on my way to Macassar. Had I been able to obtain a passage direct to that place from Singapore, I should probably never lave gone near them, and should have missed some of the most important discoveries of my whole expedition to the East.

It was on the 13 th of June, 1856 , after a twenty days' passage from Singapore in the "Kembang D)jepoon" (Rose of Japan), a schooner belonging to a Chinese merchant, manned by a Javanese crew, and conmanded by an English captain, that we cast anchor in the dangerous rondstend of Jileling on the north side of the islaud of Bali. Going on shore with the captain and the Chinese superengro, I was at once introduced to a novel and interesting sceme. We went first to the house of the Chimese Pandar, or chief merchant, where we foum a number of uatives, well dressed, and all conspicmously amed with krisses, displaying their large handles of ivory or gold, or beautifully grained and polished wood.

The Chinamen had given up their national costume and adopted the Malay dress, and could then hardly be distinguished from the natives of the island-an indication of the close affinity of the Malayan and Mongolian races.

Under the thick shade of some mango-trees close by the house, several women-merchants were selling cotton goods; for here the women trade and work for the benefit of their husbands, a custom which Mahometan Malays never adopt. Fruit, tea, cakes, and sweetmeats were brought us; many questions were asked about our business and the state of trade in Singapore, and we then took a walk to look at the village. It was a very dull and dreary place; a collection of narrow lanes bounded by high mou walls, enclosing bamboo houses, into some of which we entered and werevery kindly received.

During the two days that we remained here, I walked ont into the surrounding conntry to catch insects, shoot birds, and spy out the nakedncss or fertility of the land. [ was both astonished and delighted; for as my visit to Java was sone years later, I had never beheld so benatiful ant well cultivated a district out of Europe. A slightly undulating plain extends from the sea-const about ten or twelve miles inland, where it is bonnded by a fine range of wooded and cultivated hills. Houses and villages. marked out by dense clumps of cocoa-nut palms, tamarind and other fruit trees, are dotted about in every direction: while between them extend luxuriant rice-grounds, watered by an elaborate system of irrigation that would be the pride of the best cultivated parts of Europe. The whole surface of the country is divided into irregular patehes, following the undulations of the ground, from many acres to a few perches in extent, each of which is itself perfectly level, but stands a few inches or several feet above or below those adjacent to it. Every one of these patches can be Hoorted or drained at will, by means of a system of ditches and small chanmels, into which are diverted the whole of the streams that descend from the mountains. Every patch now bore crops in various stages of growth, some almost ready for cutting, and all in the most flourishing condition and of the most exquisite green tints.

The sides of the lanes and bridle roads were often edged with prickly Cacti and a leafless Eupliorbia, but the country being so highly cultivated there was not inuch room for indigenous vegetation, except upon the sea-beach. We saw plenty of the fine race of domestic cattle descended
from the Pos sondaieus of Java, driven by half-naked boys, or tethered in pasture-grounds. They are large and handsome animals, of a light brown colour, with white legs, and a conspicuous oval patch behind of the same colour. Wild cattle of the same race are said to be still found in the mountains. In so well-cultivated a country it was not to be expected that I could do much in natural history, and my ignorance of how important a locality this was for the elucidation of the geographical distribution of animals, caused me to neglect obtaining some specimens which I never met with agatn. One of these was a weaver bird with a bright yellow heard, which built its bottleshaped nests by dozens on some trees near the leach. It was the Ploceus hypoxinthus, a native of Java; and here, at the extreme limits of its range westerly. I shot and preserved specinens of a wagtail-thrush, an oriole, and some starlings, all species found in Java, and some of them peculiar to that island. I also obtained some heautiful butterilies, richly markel with black and orange on a white ground, and which were the most abundant insects in the country lanes. Among these was a new species, which I have named Pieris tamar.

Leaving Bileling, a pleasant sail of two days brought us to Ampanam in the island of Lombock, where I propused to remain till I could oltain a passage to Macassar. We enjoyed superb views of the twin voleanoes of Bali and Lombock, each about eight thousand feet high, which form magnificent objects at sumise and sunset, when they rise out of the mists and clouds that surroud their bases, glowing with the rich and changing tints of these the most charming moments in a tropical day.

The bay or roadstend of Ampanan is extensive, and lecing at this season sheltered from the prevalent southmasterly winds, was as smooth as a lake. The beach of black roluanic sand is very steep, and there is at all times " heaty surl upon it, which during spring-tides increases to such an extent that it is often impossible for boats to laud, and many serious accidents have oceurred. Where we lay auchored, about a quarter of a mile from the shore, not the slightest swell was perceptible, but on approaching nearer undulations began, which rapidly increased, so as to
form rollers which toppled over on to the beach at regular intervals with a noise like thumder. Sometimes this surf increases suddenly during perfect calms, to as great a force and fury as when a gale of wind is blowing, beating to preces all boats that may not have heen hauled sufficiently high upon the beach, and carrying away incautious natives. This violent surf is pobally in some way dependent on the swell of the great southern vecon, and the violent currents that flow through the Straits of Lombock. These are so wnecrain that ressels preparing to anchor in the baty are sometimes suduenly swept away into the strats, and are not able to gro back again for a fortnight! What seamen call the "ripples" are also very violent in the straits, the sea appearing to boil and foan and danen like the rapids below a cataract; vessels are swept about helpless, and small ones are occasionatly swamped in the tinest weather and under the brightest skies.

I felt considerably relioved when atl my boxes and myself had passed in salety throngh the devouring surl, which the natives luok apon with sone pride, saying, that "their sea is always humgry, and eats up everything it can eatch." I was kindly received by Mr. Carter, an Finglishman, who is one of the Bandars or licensed traders of the port, who oflered me hospitality and every assistanee during my stay. His house, storchouses, and ollices were in a yard surrounded by a tall bambon lenee, and were entirely constructed of bumboo with a thatch of grass, the only avalable building materials. Even these were now very scarce, owing to the great consumption in rebailding the flace since the great fire some months before, which in an hotu or two had destroyed every building in the town.

The next day I went to see Mr. S., anohser merchant to whom I had brought letters of introduction, and who lived about seven miles ofl. Mr, Carter kindly lent met a horse, and I was accompauided by a young Duteh gentleman residing at Ampanara, who offered to be my gruide. We first passed through the town and suburbs along a straight road bordered by mud walls and a fine avente of lofty trees; then through riee-fields, irrigated in the same manner as I had seen them at Bileling, and afterwards over sandy pastures near the sca, aud occasionally aloug
the beach itself. Mr. S. received us kindly, and offered me a residence at his house should I think the neighbourhood favoumble for my pursuits. Alter an early breakfast we went out to explore, taking guns and insect-net. We reached some low hills which seemed to offer the most favourable ground, passing over swamps, sandy flats overgrown with coare sedges, and through pastures and etltivated grounds, linding however very little in the way of either birds or insects. On our way we passed oue or two human skeletons, euclosed within a small bambon fence, with the clothes, pillow, mat, and betel-box of the unfortunate individual, -who had heen cither murdered or executed. Beturning to the house, we found a Balinese chief and his followers on a visit. Those of higher rank sat on chairs, the others squatted on the floor. The chiet very coolly asked for beer and brandy, and helped himself and his followers, aprarently more out of curiosity than anything else as regards the beer, for it scemel very distasteful to them, while they drank the brandy in tumblers with mucls relish.

Returning to Ampanam, I devoted myself for some days to shooting the birds of the neighborhool. The fine figtrecs of the avenues, where a market was held, were tenanted by superb orioles (Oriolus broderpii) of a rich orange colour, and pecular to this island and the adjacent ones of Sumbnwa and Flores. All round the town were abundance of the curions Tropidorhynchus timoriensis, allied to the Friar bird of Australia. They are here called "Quaich-quaich," from their strange loud voice, which seems to repeat these words in various and not unmelodious intomations.

Bery day boys were to be seen walking along the roads and by the loedges and ditches, eatching dragon-flies with birdlime. They carry a slender stick, with a few twigs at the enl well anointed, so that the least toneh enptures the insect, whose wings are pulled off before it is consigned to a small basket. The dragon-1lies are so abundant at the time of the rice flowering that thousands are soon caught in this way. The bodies are fried in oil with onions and preserved shrimps, or sometimes alone, and are considered a great delicacy. In Borneo, Celcbes,
and many other islands, the larve of bees and wasps are caten, either alive as pulled ont of the cells, or fried like the dragon-flies. In the Moluccas the grubs of the palmbeetles (Calandra) are regularly hrought to market in bennboos, and sold for food : and many of the great horned Lamellicorn bentles are slighty roasted on the embers and eaten whenever met with. The superalumance of insect life is therefore turned to some account by these islanders.

Finding that birds were not very namerous, and hearing much of Labuan Tring at the southern extremity of the bay, where there was said to be much mentivated country and plenty of birds ats well as deer and wild pigs, I determined to go there with iny two servants, Ali, the Malay lad from Borneo, and Mamel, a Portuguese of Malacea acenstomed to bird-skimning. I hired a native hoat with outriggers, to take us with our small quantity of luggarge, and a day's rowing and tracking aloug the shore brought us to the placo.

I had a note of introdnction to an Amboyncse Malay, and obtained the use of part of his house to live and wori in. His name was "Inchi Daul" (Ar. Dasid), mad he was very civil; but his accommodations were limited. and be could only give ne part of his reception-room. This was the front part of a bamboo house (reached by a ladder of about six romms very wide apart), and havine a beatimd view over the hay. However, I soon made what arratmements were possible, and then set to work. The country around was prety and novel to me, consisting of abrugt voleanic hills enclosiner that valleys or open phains. The hills were covered with a dense sermbly bush of hambers and prickly trees and shrubs, the plains were adorned with hundreds of noble palm-trees, and in many places with a luxuriant shrubly veretation. Sirds were plentiful and very interesting, mud I now saw for the first time many Australian forms that are quite alsent limm the islands westward. Small white cockatoos were abumdant, and their loud screans, conspicuous white colour, and pretty yellow erests, rendered them a very important feature in the landscape. This is the most westerly point on the globe where any of the family are to be found. Some small houeysuckers of the genus Ptilotis, and the strange
mound-maker (Megapodius gouldii), are also here first met with on the traveller's journey enstward. The lastmentioned bird requires a fuller notice.

The Megapodide are a small family of hirds found only in Australia and the surrounding islands, but extending as far as the Philippines and North-west Lorneo. They are allied to the gallinaceous birds, but differ from these and from all others in never sitting upon their cegs, which they bury in sand, earth, or rubbish, and leave to he hatched by the heat of the sun or of fermentation. They are all characterised by very large feet and long cunved claws, and most of the species of Megapolius rake and scratch tugether all kinds of rubbish, dead leaves, sticks, stones, earth, rotten wood, \&c., till they form a large momd, often six feet high and twelve feet ncross, in the midde of which they bury their egegs. The natives can tell by the condition of these mounds whether they contain eges or not ; and they rob them whenever they can, as the brick-res tugg (as large as those of a swan) are considered a great delieacy. A number of lirds are said to join in making these mounds and lay their egus together, so that sometimes forty or filty may be found. The mounds are to be nuet with here and there in dense thickets, and are great puzzles to strangers, who camot understand who can possilly have heaped together cartluads of ruldish in such out-of-the-way places; and when they inquire of the natives they are lint little wiser, for it almost always appears to them the willest romance to be told that it is ail done by birds. The species fomer in Lombock is about the size of a small hen, and entively of dark olive and hrown tints. It is a miscellaneous feeder, devouring fallen fruits, carth-worms, snails, and centipectes, but the 0esh is white and well-flavoured when properly cooked.

The large green pigeons were still better eating, and were much more plentiful. These fine binds, exceeding our largest tame pigeons in size, albounded on the palm-trees, which now bore huge bunches of fruits-mere hard globular nuts, about an inch in diameter, and covered with a dry yreen skin and a very small portion of pulp. Looking at the pigeon's bill and heal, it would seem impossible that it could swallow such large masses, or that it could obtain
any nourishment from them; yet I often shot these birds with several palm-fruits in the crop, which generally burst when they fell to the ground. I obtained here eight species of Kingfishers, among which was a very beautiful new one, named ly Mr. Gould, Haleyon fulgidus. It was found always in thickets, away from water, and seemed to feed on snails and insects picked up from the ground after the mauner of the great Laughing Jackass of Australia. The benutiful little violet and orange species (Ceyx rufidorsa) is found in similar situations, and daris rapidly along like a flame of fire. Here also I first met with the pretty Australian Bee-eater (Merops ornatus). This elegant little bird sits on twios in open places, gazing eagerly around, and durting off at intervals to seize some insect which it sees flying near; returning afterwards to the same twig to swallow it. Its long, sharp, curved lill, the two long narrow feathers in its tail, its beautiful green plumage varied with rich brown and black and vivid blue on the throat, render it one of the most graceful and interesting objects a maturalist cam see for the first time.
Of all the birls of Lomboek, however, I sought most after the beautilul ground thrushes (Pitta concima), and always thought myself lucky if I obtained one. They were found ouly in the dry plains densely covered with thickets, and carpeted at this season with dead leaves. They were so shy that it was very difficult to get a shot at them, and it was only alter a gond deal of practice that I discovered how to do it. The habit of these birds is to hop about on the ground, pieking up insects, and on the least almon to run into the dusest thicket or take a flight close along the ground. At intervals they utter a peculiar ery of two notes which when once heard is easily recognised, and they can also be heard hopping along amoug the dry leaves. My practice was, therefore, to walk cautiously along the narrow pathways with which the country abounded, and on deteeting any sign of a l'itta's vicinity to stand motionless and give a gentle whistle occasionally, imitating the notes as near as possible. After hall an hour's waiting 1 was olten rewarded by seeing the pretty bird hopping along in the thicket. Then I would perhaps lose sight of it again, till, having my gun raised and ready
fir a slot, a second glimpse would cuable me to secure my pize, and idmire its soft puffy plumage and lovely colours. The upper part is rich solt green, the houd jut hack with a stripe of blue aml brown over cach are ; at the hase of the tail and on the shoulders are bands of hright silvery hue, and the under side is delicate louff with a stripe of rich crimson, lordered with hack on the belly. Deautiful grass-green doves, little crimson and hack fower-peckes, barge black cnekoos, motallic king-crows, gnklen oryoles, and the tine jungle-cous-the origin of all ont domestic breeds of poultry-were among the hirds that chiclly attracted my attention during our stay at Lahuan Tring.

The nost chameteristic feature of the jungle was its thorniness. The shrubs were thorny; the creepers were thomy; the bamben even were thorny. Fwerything grew rigzag and jarerel, and in an inextricable tangle, so that to gut through the bush with gun or net or aven spectacles, was generally not to be done, and insect-catching in such lemalities was out of the question. It was in sucle phaces Hat the Pidtas oftern holked, and when shot it becane a mather of some diflienty to secure the bivd, aml seldom whout a heary payment of pricks and scratches and torn clothes could the brize be won. The dry volcanic soil and arid elimate seem favourable to the production of such stunted and hhorny vegetation, for the natives assured me that this was nothing to the thorns and prickles of Sumbawa, whose surface still bears the covering of volennic ashes thrown out forty years ago by the terrible eruption of Tomboro. Among the shruls and trees that are not prickly the $A$ pocynacere were most abundant, their bilobed fruits of varied form and colour and often of most tempting appearance, langing everywhere by the waysides as if to invite to destruction the weary traveller who may be unaware of their poisonous properties. One in particular with a smooth shining skin of a golden omage colour rivals in appearance the golden apples of the Hesperides, and has great attractions for many birds, from the white cockatoos to the little yellow Zosterops, who feast on the crimson seeds which are displayed when the fruit bursts open. The great palm called "Gubbong" by the natives, a species of Corypha, is the most striking feature of the
plains, where it grows by thousands and appears in three different stales-in leaf, in flower and fruit, or dead. It has a lofty cylindrical stem about a humdred fect high and two to three fect in diameter; the leaves are large and fanshaped, and fall off when the tree flowers, which it does only once in its life in a huge terminal spike, on which are produced masses of a smooth round fruit of a green colour and about an inch in dameter. When these ripen and fall the tree dies, and remains standing a year or two before it falls. Trees in leaf only are by far the most numerous, then those in flower and fruit, while dead trees are seattered here and there among them. The trees in fruit are the resort of the great greex fruit pigeons, which have been already mentioned. Trops of monkeys (Macacus eynomolgus) may often be sten occupying a tree, showering down the fruit in great profusion, chattering when disturbed and making an enormous rustling as they scamper off among the dead palm leaves; while the pigeons have a loud booming voice more like the roar of a wild beast than the note of a bird.

My collectiog operations here were carried on under more than usual difficulties. One small pom had to serve for eating sleeping and working, for storelonse and dissectingroom; in it were no shelves, cupbonds, chairs or tables; ants swarmed in every part of it, int ilogs, cats and fowls entered it at pleasure. Besides this it was the parlour and reception-room of my host, and $I$ was ohliged to consult his convenience and that of the numerous nyests who visited us. My principal piece of fumiture was a box, which served me as a dining-table, a seat while skinning hirds, and as the receptacle of the birds when skinned and dried. To keep them free from ants we horrowed, with some dilliculty, an old bench, the four legs of which beine plateed in cocon-nut shells filled with water kept us tolerably free from these pests. The box and the bench were however literally the only places where anything condd bo put away, and they were generally well occapied by two insect boxes and about a hundred biris' skins in process of drying. It may therefore be easily conceived that when anything bulky or out of the common way was collected, the question "Where is it to be put?" was rather a diffi-
cult one to answer. All animal substances moreover require some time to dry thoroughly, emit a very disagreeable odour while doing so, and are particularly attractive to ants, flies, dogs, rats, cats, and other vermin, calling for especial cautions and constant supervision, which under the circumstances above described were impossible.

My readers may now partially understand why a travelling uaturalist of limited means, like myself, does so much less than is expected or than he would himself wish to do. It would be interesting to preserve skeletons of many birds and animals, reptiles and fishes in spirits, slins of the larger animals, remarkable fruits and woods and the most curious articles of manufacture and commerce: but it will be seen that under the circumstances I have just described it would have been impossible to add these to the collections which were my own more especial favourites. When travelling by hoat the difficulties are as great or greater, and they are not diminished when the journey is by land. It was absolutely necessary therefore to limit my collections to certain groups to which I could devote constant personal attention, and thus secure from destruction or decay what had been often obtained by much labour and pains.

While Manuel sat skinning lis birds of an afternown, generally surcounded by a little crowd of Malays and Sassaks (as the indigenes of Lombock are termed), he often held forth to them with the air of a teacher, and was listened to with profound attention. He was very fond of discoursing on the "special providences" of which he believed he was daily the subject, "Nlah has been merciful to-day," he would say-for although a Christian he adopted the Mahometan mode of speech-" and has given us some very fine birds; we can do nothing without him." Then one of the Malays would reply, "To be sure, birds are like mankind; they have their appointed time to die; when that time comes nothing can save them, and if it has not come you cannot kill them." A murmur of assent follows this sentiment, and cries of "Butul! Butul!" (Right, right.) Then Manuel would tell a long story of one of his musuccessful hunts; - how he saw some fine bird and followed it a long way, and then missed it, and again found
it, and shot two or three times at it, but conld never lait it. "Ah!" says an old Mahay, "its time was not come, and so it was impossible for you to kill it." A doctrine this which is very consoling to the bad marksman, and which quite accounts for the faets, but which is yet sonchow not altogether satisfactory.

It is universally believed in Lomboek that some men have the power tu turn themselves into eroeotiles, which shey do for the sake of devouring their enemies, and many strange tales are told of such transtormations. I was therefore rather surprised one evening to hear the following curious fact stated, and as it was not contradicted by any of the persons present I am inclined to accept it provisionally, as a contribution to the Natural History of the istand. A Bornean Malay who had ben for many years resident here sad to Mantel, "One thing is strange in this country - the scarcity of ghosts." "IIow so ?" asked Manuel. "Why, you know," said the Malay, "that in our countries to the westward, if a man dies or is killed, we dare not pass near the place at night, for all sorts of noises are heard which show that ghosts are about, liut here there are numbers of men killed, and their bodies lic unburied in the fields and by the roadside, and yet you car. walk by them at night and never hear or see anything at all, which is not the case in our country, as you know very well." "Certainly I do," said Manuel; aut so it was settled that ghosts were very scarce, if not altogether unknown in Lombock. I would observe, however, that as the evidence is purely negative we should be wanting in scientifie caution if we accepted this fact as sulticiently well established.

One evening I heard Manuel, Ali, and a Malay man whispering earnestly together outside the door, and coukd distinguish various allusions to "krisses," throat-cutting, heads, \&c. foc. At leugth Manuel came in, looking very solemn and frightened, and said to me in English, "Sirmust take care;-no safe here ;-want cut throat." On further inquiry, I found that the Malay had been telling them, that the Rajah had just sent down an order to the village, that they were to get a certain number of heads for an offering in the temples to secure a good crop of rice.

Two or three other Malays and Bugis, as well as the Amboyna man in whose house we lived, contirmed this account, and declared that it was a regular thing every year, and that it was necessary to keep a rood watel and never go out atone. I laughed at the whole thing, and tried to persuale them that it was a mere tale, but to mo effect. They were all limmy persumed that their lives were in danger. Manus would not go ont shooting alone, and I was obliged to acompany lim every morning, lut I soon gave him the slip in the jungle, Ali was afrad to go and look for firewood without a companion, and would not even fetch water from the well a few yards behind the house moses armed with an enomous spear. I wats quite sure all the time that no such order had been sent or received, and that we were in perfect safety. This was well shown shortly afterwards, when ans American sathor ran away from his ship on the east side of the island, and made his way on foot and unarmed across to Ampanam, having met with the greatest hospitality on the whole route. Nowhere would the smallest payment lie taken for the food and lodging which were willingly furnished him. On pointing ont this fact to Manuel, he replied, "ILe one bud man,-run away from his ship,-no one can believe word he say ;" and so I was obliged to leave him in the meomfortable persuasion that he might any day have his throat cut.

A circumstance occurred here which appeared to throw some light on the cause of the tremendous surf at Ampanam. One evening I heard a strange rumbling noise, and at the same time the house shook slightly, Thinking it might be thunder, I asked, "What is that ?" "It is an earthquake," answered Inchi Dand, my host ; and he then told me that slight shocks were occasionally felt there, but he had never known them severe. This happened on the day of the bast quarter of the moon, and consequently when the tides were low and the surf usually at its weakest. On inquiry afterwards at Ampanam, [ found that no earthquake had been noticed, but that on one night there bad been a very heavy surf, which shook the house, and the next day there was a very high tide, the water having flooded Mr. Carter's prenises, higher
than he had ever known it before. These numsual tides occur every now and then, and are not thought much of ; but by careful inquiry I ascertained that the surf had occurred on the very night I had felt the earthquake at Labuan Tring, nearly twenty miles off. This would seem to indicate, that although the ordinary heavy surf may be due to the swell of the great Southern Ocean confined in a narrow channel, combined with a peeuliar form of bottom near the shore, yet the sudden heavy surfs and high tides that oceur oceasionally in perfectly calm weather, may be due to slight upheavals of the ocean-bed in this eminently volcanic region.

## cliapter XI.

Lombock: manners and customs of tie people.

HAVING made a very fine and interesting collection of the birds of Labuan Tring, I took leave of my kind host, Inchi Dand, and returned to Ampanan to await an opportunity to reach Macassar. As no vessel had arrived bound for that port, I determined to make an excursion into the interior of the island, nccompanied by Mr. Ross, an Englishman born in the Keeling Islands, and now employed by the Dutch Government to settle the affains of a missionary who had unfortanately become bankrupt here. Mr. Carter kindly lent me a horse, and Mr. Ross took his native groom.

Our route for some distance lay along a perfectiy level country, bearing ample crops of rice. The road was straight aud generally bordered with lofty trees forming a fine avenue. It was at first sandy, afterwards grassy, with oceasional streams and mud-holes. At a distance of about four miles we reached Mataram, the capital of the island aud the residence of the Rajah. It is a large village with wide streets bordered by a magnificent avenue of trees, and low houses concealed behind mud walls. M 2

Within this royal city no mative of the lower orders is allowed to ride, and otir attendiant, it Wavanese, was obliged to dismount and lead his horse while we rode slowly through. The aboles of the Rajah and of the High l'riest are distinguished by pillars of red brick constructed with much taste; but the palace itself seemed to difler but little from the ordinary houses of the country. Beyond Mataram and close to it is Karangassam, the ancient ressidence of the native or Sassak Rajahs before the conquest of the island by the Balinese.

Soon after passing Mataram the country begran gradually to rise in mentle molulations, swelling occasionally into low hills fowarls the two mountamons tracts in the northern and southern parts of the island. It was now that I first obtained an aldequate dea of one of the most wonderful systems of cultivation in the work, equalling all that is relame of Chinese industry, and as far as I know surpassing in the labour that has been bestowed upon it any tract of equal extent in the most civilized countries of Liurope. I rome throngh this strange garden utterly amazed, and hardly able to realize the fact, that in this remote aut little known island, from which all Europeans except a few traters at the port are jealonsly excluded, many hundreds of square miles of imerglarly undulating country have been so skilfully terraced and levelled, and so permeated by artificial channels, that every portion of it can be irrigated and dried at pleasure. According as the slope of the ground is more or less rapid, each terraced Hot consists in sone places of many acres, in others of a few square yards. We saw them in every stato of cultivation; some in stubble, some being ploughed, some with rice-crops in various stages of growth. Here were luxuriant patches of tobacco; there, cucumbers, sweet potatoes, yams, beaus or Indiau-corn, varied the scenc. In some places the ditches were dry, in others little streams crossed our road and were distributed over lands about to be sown or planted. The bonks which bordered every terrace rose regularly in horizontal lines above each other; sometimes rounding an abrupt knoll and looking like a fortification, or sweeping round some deep hollow and forming on a gigantic scale the seats of an amphi-
theatre. Every brook and rivulet liad been diverted from its bed, and instead of Llowing along the lowest ground were to be found crossing our road half-way up an aseent, yet borlered by ancient trees and moss-growa stenes so as to have all the appeamace of a natural chanuel, and bearing testimony to the remote period at which the work had been done. As we advanced further into the country, the scene was diversified by abrupt rocky hills, by stecep ravines, and by clumps of bambons and palm-trees near houses or villages; while in the distance the tine ande of mountains of which Lombock peak, eight thousand leet high, is the culmimating point, formed a fit hackground to a view scarcely to be surpassed either in buman interest or picturesque beauty.

Along the first part of our road we passed humdrels of women carrying rice, fruit, aud vegetables to market; and further on an almost minterrupted line of horses laden with rice in bags or in the ear, on their way to the port of Ampanam. At every few miles along the road, seated under shady trees or slight sheds, were sellers of sugatcane, palm-wine, cooked rice, salted eggs, and fried plantains, with a lew other native delicacies. At these stalls a hearty meal may be made for a permy, but we contented ourselves with drinking some sweet palm-wine, a most delicious beverage in the heat of the day. After having travelled about twenty miles we reached a higher and drier region, where, water being scaree, cultivation was condined to the lithe flats burkring the streans. Here the country was as beatiful as before, but of a different character; consisting of undalating downs of short turf interspersed with line chumps of trees and bushes, sometimes the woodhand, sometimes the open ground predominating. We only passed through one suall patch of trie fortst, where we were shaded by lofty trees and saw around us a dark and dense vegetation, highly agreeable atter the heat and glare of the open country.

At length, about an hour after noon, we reached our destination-the village of Compang, situated nearly in the centre of the island-and entered the outer court of a house helonging to one of the chief's with whom my friend Mr. Ross had a slight acquaintance. Here we were re-
quested to seat ourselves under an open shed with a raised floor of Lomboo, a place used to receive visitors and hold audiences. Tuming our horses to graze on the luxuriant grass of the courtyard, we wailed till the great man's Malay interpreter appeared, who inquired our business and informed us that the Pumbutkle (chief) was at the Rajah's house', but would soon lie bick. As we had not yet breakfasted, we berged le would get us something to eat, which he promised to do as soon as possible. It was however about two hours before anything appeared, when a small traty was brought containing two sancers of rice, four small tried fish, and a few vegetables. Having made as good a breakfast as we cond, we strolled about the village, and returning, amned ourselves ly conversation with a number of men and boys who gathered round us; and by exchanging ghanees and smiles with a number of women and gits who peeped at us throtgh half-opened doors and other crevices. Two little boys named Mousa and Isa (Moses and Jesus) were great friemds with us, and an impulent little maseal called Kachang (a bean) made us all laugh by his mimicry and antics.

At length, ahont four o'clock, the Pumbuekle made his appearance, and we informed lim of our desire to stay with him a few days, to sloot hirds and see the country. At this he seemed somewhat disturbed, and asked il we had brought a letter from the Arak Agong (Son of Leaven), which is the title of the Rajah of Lombock. This we had not done, thinking it quite unnecessary; and he then athmpty told us that he must gro and speak to his Rajah, to see if we could stay. Hows passed away, night came, and he did not retum. I began to think we were suspected of some evil designs, for the l'umbutke was evidently afraid of getting himself into trouble. He is a Sassak prince, and, though a supporter of the present Rajah, is related to some of the heads of a conspinacy which was quelled a few years since.

About five oclock a pack-horse bearing my guns and clothes arrived, with my men Ali and Manael, who had come on foot. The sun set, and it soon became dark, and we got rather lungry as we sat wearily under the shed and no one came. Still hour after hour we waited, till
about wine o'clock, the Pumbuckle, the Rajah, some priests, and a number of their followers arrived and took their seats around us. We shook hands, and for some minutes there was a dead silence. Then the Majah asked what we wanted; to which Mr. Ross replied by endeavouring to make them understand who we were, and why we had rome, and that we had no sinister intentions whatever ; and that we lat not brought a letter from the "Anak Agoug," merely because we had thought it quite unmeeessary, A long cunversation in the Bali languare then took place, and questions were asked about my guns, and what powder I had, and whether I used shot or lollets: aldo what the hirds were for, and how I preserved them, and what was done with them in Sengland. Each of my answers and explanations was followed by a low and seriou; ronversation which we could not underitant, hut the purlurt of which we could guess. They were evidently quit. pataled, and did not bulieve a worl we had tohd them. They then inquired if we were ratly Enolish, and not D) oteh ; and although we strongly asserted our mationality, they did not seen to believe us.

Atter akout an hour, however, they hrought us some shbuce (which was the sume as the breakfast, hat without the fishy, and alter it some very weak coltee and pumpkius bothed with sharar. Having diseussed this, a second conference took place; questions were again asken, and the :uswers again commented on. Between whiles lighter topies were discussed. My spectacles (eoneave hhases, were tried in succession by three or four old nem, who rould not nake out why they could not see throngh them, and the fact no doubt was another item of suspicion anainst me. Ay beard, too, was the sulgeet of some ablmiration. and nany questions were asked abont personal peculiarities which it is not the custom to allude to in Jimopean sociely. At length, aluout one in the morning, the whole party bose to depart, ind, after conversing some fime at the gate, all went away. We now begred the interpreter, who witla a few boys and men remainod about us, to show us a flace to sleepin, at which he sethed very much surprised, saying he thought we were very well atcommodited where we wert. It was quite chilly, and
we were very thinly clad and had brought no blankets, lut all we could get after another hour's talk was a native mat and pillow, and a few old curtains to lang round three sides of the opeu shed and protect us a little from the coll breeze. We passed the rest of the night very uncomfortably, and determined to return in the morning and not submit any longer to such shabby treatment.

We rose at daybreak, but it was near an hour before the interpreter made his appearance. We then asked to have some cottice and to see the Pumbuckte, as we wanted a horse for Ali, who was lame, and wished to bid him adien. Tlye man looked puzzled at such unheard-of dewands and vanished into the inner court, locking the door behind him and leaviug us again to our meditations, An hour passed and no one came, so 1 ordered the horses to be saddled and the pack-horse to be loaded, and prepared to sturt. Just then the interpreter came up on horseback, and looked aghast at our preparations. "Where is the Pumbuckle ?" we asked. "Gone to the Rajah's," said he. "We are going," said l. "Oin ! pray don't," said he; "wait a little; they are having a consultation, and some priests are coming to see you, and a clicf is going ofl to Mataram to ask the permission of the Anak Agong for you Lo stay." This settled the matter. More talk, more delay, and another eight or ten hours consultation were not to be endurcl; so we started at once, the poor interpreter almost weeping at our obstinacy and hurry, and assuriug us"the l'umbuckle would be very sorry, and the Rajali would bo very sorry, and if we would but wait all would be right." I gave Ali my horse, and started on foot, but he atiterwards momted behind Mr. Ross's grom, and we got home very well, though rather hot and tired.

At Mataram we called at the house of Gusti Gadioca, one of the princes of Lombock, who was a friend of Mr. Carter's, and who had promised to show me the guas made by native workmen. Two gums were exhibited, one six the other seven feet long, and of a proportionably large bore. The barrels were twisted and well finished, though not so dinely worked as ours. The stock was well made, and extended to the end of the barrel. Silver and gotd cruameat was inlaid over most of the surface, but the
locks were taken from English muskets. The Gusti assured me, however, that the Rajah had a man who made locks and also riflerl barrels. The workshop where these gras are made and the tools used were next shown us, and were very remadsable, An open shed with a couple of small mud forges were the chief objects visible. The bellows consisted of two bamboo cylinders, with pistonti worked by hand. They muve very easily, having a luose stubfing of feathers thickly set round the piston so as to ant as a valve, and produce a regular blast. Both cylinders communicate with the sane nozzle, one piston rising while the other falls. An oblong piece of iron on the groumd was the anvil, and a small viee was fixed on the projecting root of a tree outside. These, with a fow files and hammers, were literally the only tools with which an ohd unan makes these fine guns, finishing them limself from the rough iron and wood.

I was anxious to know how they bored these long barrels, which seemed perfectly true and are said to shoot atmirably; and, on asking the Gusti, received the enismatical answer : "We use a basket full of stones." Beins utterly unable to imagine what he conld mean, I asked if I coukd see low they did it, and one of the duzen little boys around us was sent to fetch the basket. He som returned with this most extrandinary buther-machine, the mode of using which the Gusti then exphaned to we. It was simply a strong bamboo hasket, through the botom of which was stuck urright a pole about thee feet long, kent in its place by a fee stieks tied across the top with ratame The bottom of the pole has an bron ring, and a hole in which fons-conered borers of hardened iron can he fitted. The barrel to be bored is buried upright in the grombd, the borer is inserted into it, the top of the stick or vertical shaft is beld by a cross-piece of bamboo with a lowle in it, and the basket is filled with strmes to get the required weight. Two boys turn the bamboo romod. The barrels are made in pieces of about eirhteen inches longs, which are first bored small, and then wehed tugether upon a straght iron rod. The whole barrel is then worked with borers of graduatly increasing size, and in three days the boring is finisbed. The whole matter was explained in
such a strainhtforward mamer that I have no doubt the process described to me was that actually used; although, when exanining one of the handsome, well-finished, and serviceable gmos, it was very hard to realize the fact, that they had been made from first to last with tools hardly sutiicient for an English Whacksmith to make a horse-shoe.

The day after wo roturned from our excursion, the Rajals cane to Anpanam to a feast given by Gusti Gidioca, who resides there; and son after his arrival we went to have an mulience. We foum him in a large rourtyard sitting on a mat under a shady tree; and all his
followers, to the number of three or four hundred, squatting on the ground in a large circle round him. He wore a sarong or Malay petticont and a green jacket. He was a man about thirty-five years of age, and of a pleasing countenance, with some appearance of intellect combincil with indecision. We lowed, and took our seats on the shound near some chiefs we were acquaintel with, for while the Rajah sits no one ean stand or sit higher. Ho first inquired who I was, and what I was doing in Lomlowek, and then requested to see some of my birds. 1 arcordingly sent for one of my loxes of hird-skins and one of insects, which he examined carefully, and seemed much surprised that they eould be so well preserved. We then had a little conversation about Furope and the Russian war, in which all natives take an interest. Having heare much of a country-sent of the Rajah's called Gunong Sari, I took the opportunity to ask permission to visit it and sloot a few hirds there, which he immediately granted. I then thanked him, and we took our leave.

An hour after, his son came to visit Mr. Carter accompanied by about a hundred followers, who all sat on the ground while he came into the open shed where Manuel was skinning birds. After some time he went into the house, had a bed arranged to slepp a little, then drauk some wine, and after an hour or two had dimer brought him from the Gusti's house, which he ate with eight of the principal priests and princes. He pronouced a Whessing over the rice and commncel eating tirst, after which the rest fell to. They rolled up balls of rice in their hands, dipped them in the gravy and swallowed them rapidy, with little pieces of meat and fowl cooked in : variety of ways. A boy fanned the young Rajah while cating. Ite was a youth of about fifteen, and hatd already three wives. All wore the kris, or Malay crooked dagger, on the beauty and value of which they greatly pride themselves. A companion of the lajah's had one with a rolden landle, in which were set twenty-eight diamonds and several other jewels. He said it had cost him 700 l . The sheaths are of ornamental wood and ivory, often covered on one side with gold. The blades are beautifully
veined with white metal worked into the iron, and they are kept very carefully. Every man without exception carries a kris, stuek behind into the laver waist-cloth which all wear, and it is generally the most valuable piece of property he possesses.

A few days afterwards our long-talked-of excursion to Gunong Sari took place. Our party was increased by the eaptain and supercargo of a Mamburg ship loading with rice for China. We were mounted on a very miscellaneous lot of Lombock ponies, which we lad some difliculty in supplying with the necessary saddles, \&c. ; and most of us had to patch up our girths, bridles, or stirrup-leathers, as best we could. We passed through Mataram, where w. were joined by our friend Gusti Gadioca, monnted on a landsome hack horse, and riding as all the natives do. without sadile or stirpups, using only a handsome saddecloth and very omamental bridle. About three miles further, along pleasant hyways, brought us to the phace. We entered through a rather handsome brick gateway supported by hideons Hindoo teities in stone. Within was an enclosme with two square fish-ponds and some line trees: then another gateway through which we entered into at park. On the right was a brick house, huilt somewhat in the Hindon style, and placed on a high termace or platturm; on the left a larye fish-pond, supplied by a little rivulet which entered it rint of the mouth of a gigatio crocodile. well executed in hick and stone. The edges of the pond wre bricked, and in the contre rose a fantastic aml jetuwosque pavilion amamented with grotesque statues. The poud was well stocked with fine tish, which come every moming to be fed at the sound of a wooden gong which is lung near for the purpose, On striking it a number of fish immediately came out of the masses of wed with which the pond abemons, and followed us along the mangin expecting foom. At the same time some deat came out of an adjacent wood, which, from being seldom shot at and regularly fod, are almost tame. The jungle and woods which surrounded the park appearing to abound in birds, I went to shoot a few, and was rewarded by getting several specimens of the fine new kingfisher, Halcyon fulgidus, and the curious and handsome ground thrush, Zootbera
mulromeda, The former belies its name by mot frequenting water or feeding on fish. It lives constantly in low ilamp thickets picking up ground insects, centijedes, and small mollusen. Altogether I was much pleased with my visit 1o this phee, and it gave me a higher opinion than I hat before entertained of the taste of these people, although the style of the huildings and of the sculpture is very much inferior to those of the magnificent ruins in Thya I must now say a fow womls about the chamater, mamers, and customs of these interesting people.

The aborigines of Lombock are termed Sassaks. They are a Malay race lardly differing in appearance from the people of Malacea or Jwneo. They are Mahometans and form the bulk of the pepulation. The ruling classes, on the other hand, are natives of the adjacent ishamd of Bali, and are of the Rrahminieal religion. The government is an absolute monarehy, but it seems to be conducted with more wisdom and moderation than is usual in Malay rountries. The father of the present Raphan enoquered thw ishand, and the people seem now quite reconciled to their new rulers, who do not interfere with their religion, and probably do not tax them any heavier than did the nativo chiefs they have supplantel. The laws now in foree in Lombock are very severe. Theft is punished by death. Mr. Carter informed me that a man onee stole a metal reftere-pot from his lonse. ILe was caught, the pot restored, amd the man brought to Mr. Carter to punisis as ho thought fit. All the natives recommended Mr. Carter to have him "krissed" on the spot; "for it you don't," said they, "ha will rob you again." Mr, Carter, however, let him otf, with a warning, that if he ever came inside his premises augain he would cetrainly be shot. A fiew months afterwards the same man stole a horse from Mr. Carter. The horse was recovered, but the thief was not causht. It is an established rule, that any one found in a house after dark, unless with the owner's knowledge, may be stahbed, his body thrown out into the strect or upon the beach, aud no questions will be asked.

The men are exceedingly jealous and very strict with their wives. A married woman may not accept a cigar or a sirih leaf from a stranger under pain of death. I was
informed that some years ago one of the Finglish traders had a lalinese woman of good family living with him-the comexion being considerel quite honourable by the natives. During some festival this girl offended ayainst the law lay accepting a flower or some such trifle from another man. This was reported to the hajah (to some of whose wives the girl was related), and he immediately sent to the Englishman's house ordering him to give the woman up as she must be "krissel," In vain he begred and prayed, ind offered to pay any fine the liojah might impose, and finally refused to give her up unless he was foreetl to do so. This the Rajah did not wish to resort to, as he no doubt thought he was acting as much for the Englishman's honour as for his own; so he appeared to let the matter drop. But some time afterwards he sent one of his followers to the louse, who beekoned the girl to the door, and then saying, "The liajah sends you this,", stabbed her to the heart. More serious infidelity is punished still mome cruelly, the woman and her paramour being tied back to back and thrown into the sea, where some large crowdiles are always on the watch to devour the bolies. One such execution tork phace while I was at Ampanam, lint I took a long walk into the country to be ont of the way till it was all over, thus missing the opportunity of having a horrible marrative to enliven my somewhat tedions story.

One morning, as we were sitting at breakiast, Mr. Carter's servant informel us that there was an "Amok" in the village-in other words, that a man was "running at muck." Orders were immediately given to shut and fasten the gates of our enclosure; but hearing nothing fier some time, we went ont, and found there hat been a false alam, owing to a slave having run away, dechuring he woukd "amok," becuuse his master wanted to sell him, A short time before, a man had been killed at a gaming-table because, hawing lost half-i-dollar more than he possesselt, he was going to "imoks." Another had killet or wound ed seventecu people before he could be destroyed, In their wars a whole reyiment of these people will sometimes agree to "amok," and then rush on with such energetic desperation as to be very formidable to men not so excited as themselves. Anong the ancients these would have been looked
upon as heroes ur demigods who sacrificed themselves fir their country. Here it is simply said,- they made "amols."

Macassar is the most celebnated phace in the East for "running a muck." There are said to be one or two as month on the average, and five, ten, or twenty persons are sometimes killed or wombed at one of them. It is the national and therefore the honomrable mole of committing suicide among the natives of Celetes, and is the fashionable way of eseaping from their difficulties. A Roman fell upon his sworl, a Japanese rips up his stomach, and an Englishman blows out his brains with a pistol. The Bugis mode has many advantares to one snicidically inclined. A man thinks himself wrongel by society-he is in debt and cannot pay-he is taken for a slave or has gambled away his wife or child into slavery-lue sees me way of recovering what he has lost, and becomes des wrate: He will not put up with such cruel wrongs, but will he revenged on mankind and de like a hero. He grasis his kris-handle, and the next moment draws out the weapon and stabs a man to the heart. He runs on, with bloody kris in his hand, stabbing at every one he meets. "Amok" Amok:" then resounds through the streets. Spears, krisses, knives and guns are brought out against him. He rushes madly forward, kills all he can-men, women, thul children-and dies overwhelmed by numbers anid all tho excitement of a battle. And what that excitement is those who have been in one best know, but all who have ever given way to violent passions, or even indulged in violent and exciting exercises, may form a very good idea. It is a delirious intoxication, a temporary madness that absorts every thought and every chergy. And can we wonder at the kris-learing, mintaught, brooding Malay preferring such a death, looked upou as almost honourable, to the cold-blooded details of suicide, if he wishes to escape from overwhelming troubles, or the merciless clutches of the hangman and the disgrace of a public execution, when he has taken the law into his own hands, and too hastily revenged himself upon his enemy? In either case he chooses rather to "amok."

The great staples of the trude of Lombock as well as of Mali are rice and cuffee; the former grown on the plains,
the latter on the hills. The rice is exported very largely to other islands of the Archipelago, to Singapore, and evell to China, and there are generally one or more vessels loading in the port. It is brought into Ampanam on pack-liorses, and almost every day a string of these would come into Mr. Carter's yam. The only money the natives will take for their rice is Chinese copper cash, twelve hundred of which go to a dohlar. livery morning two harge sacks of this money lad to be countel out intu, convenient sums for payment. From Iali quantitics of dried beef and ox-tongu's are exported, and from Lombork a grood many ducks and ponies. The ducks are a peeuliar hreed, which have very long flat boules, and walk erect almost like penguins. They are generally of in pale reddish ash colour, and are kept in large tlocks. They are very cheap and are lagely consund by the crews of the rice ships, by whom they are called Baly-soldiers, but ate more gencrally known elsewhere as penguin-ducks.

My Portnguese bird-stufler Fernandez now insisted on braking his agreement and returning to Singapore; partly from home-sickness, hat more I believe fron the ideat that his life was not worth many months' purchase among sueh hloodthirsty and mocivilizel peoples. It was a considerable loss to me, as I had paid him full three times the usual wages for three months in advance, half of which was occupied in the voyage and the rest in a place where I could have done without him, owing to there being so few insects that I could devote my own time to shooting and skinning. A few days after Fernandez had left, a small schooner came in bound for Macassar, to which place I took a passarge. As a fitting conclusion to my sketch of these interesting islands, I will narrate an anecdote which I leard of the present Rajah; and which, whether altogether true or not, well illustrates native character, and will serve as a means of introducing some details of the manners and customs of the country to which I have not yet alluded.

## CHAPTER XII.

## LOMBOCK: HOW THE RAJAI TOOK THE CENSUS.

THE Rajah of Lombock was a very wise man, and he showed his wisdom greatly in the way he took the census. For my readers must know that the chief revenues of the Rajah were derived from a head-tax of rice, a small measure being paid annually by every mau, woman, and child in the island. There was no doubt that every one paid this tax, for it was a very light one, and the land was fertile and the people well off; but it had to pass through many hands before it reached the Government storehouses. When the harvest was over the villagers brought their rice to the Kapala kampong, or head of the village; and no doubt he sometimes had compassion on the poor or sick and passed over their short measure, and sometimes was obliged to grant a favour to those who had complaints against him; and then he must keep up his own dimnity by having his granaries better filled than his neighbours, and so the rice that he took to the "Waidono" that was over his district was generally a good deal less than it should have been. And all the "Waidonos" had of course to take care of themselves, for they were all in debt and it was so easy to take a little of the Government rice, and there would still be plenty for the Rajah. And the "Gustis" or princes who received the rice from the Waidonos helped themselves likewise, and so when the harvest was all over and the rice tribute was all brought in, the quantity was found to be less cach year than the one before. Sickness in one district, and fevers in another, and failure of the crops in a third, were of course alleged as the cause of this falling off; but when the Rajah went to hunt at the foot of the great mountain, or went to visit a "Gusti" on the other side of the island, he always saw the villages full of people, all looking well-fed and happy. And he noticed that the krisses of his chiefs and officers were getting handsomer
and handsomer ; and the hanlles that were of yellow wooul were changed for ivory, and those of ivory were changed for sold, and diamonds and emerades sparkled on many of them; and he knew very well which way the tributerice went. But as he could not prove it he kept silence, and resolved in his own heat sone day to have a census taken, so that he might know the mumber uf lis people, and not be cheated out of more rice than was just and reasomable.

Ihut the difficulty was how to get this census. He could not go himself into every village and every house, and count all the people; and if he ordered it to be done hy the regular officers they would guiekly understand what it was for, and the census would be sure to agree exactly with the quantity of rice he got last year. It was evident therefore that to answer his purpose $n 0$ one must suspect why the census was taken; and to make sure of this, no one must know that there was any census taken at all. This was a very hard problem; and the Rajah thought and thought, as harel as a Malay Jajah can be expected to think, but could not solve it ; and so he was very unhappy, and did nothing but smoke and chew betel with his favourite wife, and eat scarcely anything; and even when he went to the cock-fight dill not seem to care whether his best birds won or lost. For several days he remained in this sall state, and all the court were afraid some evil cye had bewitched the Rajah; and an unfortumate Irish captain who had come in for a cargo of rice and who squinted dreadfully, was very nearly being krissed, but being first brought to the royal presence was gracionsly ordered to go on board and remain there while lis ship stayed in the port.

One moruing however, after about a week's continuance of this unaccountalle melancholy, a welcome change took place, for the Rajah sent to call together all the chiefs and priests and princes who were then in Mataram, his capital city; and when they were all assembled in anxious expectation, he thus addressed them:
"For many days my heart has been very sick and 1 knew not why, but now the trouble is cleared away, for I have had a dream. Last night the spirit of the 'Gunong

Agong'- the great fire mountain-appeared to me, and tokd me that I must go up to the top of the mountain. All of you may come with me to neat the top, but then I must go up alone, and the great spirit will again appear to me and will tell me what is of great importance to me and to you and to all the people of the island. Now yo all of you and make this known through the islant, and let every village furnish men to make clear a road for us to go through the forest and up the great mountain,"

So the news was spread over the whole island that the Rajah must go to meet the great spirit on the top of the mountain; and every villare sent forth its men, and they cleared away the jungle and made bridges over the mountain streams and smoothet the rongh places for the Rajah's passage. And when they came to the steep and cragry rocks of the mountain, they sought out the best paths, sometimes along the bed of a torrent, sometimes along narrow ledges of the black roeks; in one place cutting down a tall tree so as to bridge across a chasm, in another constructing ladilers to monat the smooth face of a precipice. The chiefs who superintended the work fixed upon the length of each day's journey beforeland according to the nature of the road, and chose pleasant places by the banks of clear streams and in the neighbourhood of shady trees, where they built sheds and huts of bamboo well thatehed with the leaves of palm-trees, in which the Rajah and his attendants might eat and sleep at the close of each day.

And when all was ready, the princes and priests and chief meu came again to the Rajah, to tell him what hard been done and to ask him when he would go up the mountain. And he fixed a day, and ordered every man of rank and authority to accompany lim, to do honour to the great spirit who had bid him undertake the journey, and to show how willingly they obeyed his commands. And then there was much preparation throughout the whole island. The best cattle were killed and the meat salted and sun-dried; and abundance of red peppers and sweet potatoes were gathered; and the tall pinangtrees were chimbed for the spicy betel nut, the sirih-leaf was tied up in bundles, and every man filled his tobacco pouch and lime box to the brim, so that he might not want
any of the materials for chewing the refreshing betel during the journey. And the stores of provisions were sent on a day in advance. And on the day before that appointed for starting, all the chiefs both great and small came to Mataram, the aborte of the king, with their horses and their servants, and the bearers of their sirili boxes, and their sleeping-mats, and their provisions. And they encamped under the tall Waringin-trees that border all the roads about Mataram, and with bazine fires frighted away the ghouls and evil spirits that nightly hame the gloony avenues.

In the morning a great procession was formed to conduct the Rajah to the monntain. And the royal princes and relations of the Rajals mounted their black horses, whose tails swept the ground; they used no saddle or stirrups, lont sat upon a cloth of gay colours; the bits were of silver and the lnitles of many-colonred comls. The less important people were on small strong horses of various colours, well suited to a mountain journey; and all (even the Rajah) were bare-legred to above the knee, wearing only the gity coloured cotton waist-choth, a silk or cotton jacket, ant a large handkerchief tastefully folded rom the hend. Every one was attemded hy one or two servants bearing his sirih and betel boxes, who were also mounted on ponies; and great numbers more had gone on in advance or waited to bring up the rear. The men in authority were numbered by hundreds and their followers by thousands, and all the ishand woudered what great thing would come of it.

For the first two days they went along good roads and throngl many villages which were swept clean, and where bright cloths were hung out at the windows; and all the people, when the Rajah came, squatted down upon the ground in respect, and every man riding got off his horse and squatted down also, and many joined the procession at every village. At the place where they stopped for the night, the people had placed stakes along each side of the roads in front of the houses. These were split crosswise at the top, and in the cleft were fastened little clay lamps, and between them were stuck the green leaves of palmtrees, which, dripping with the evening dew, gleamed
prettily with the many twinkling lights. And few went to sleep that night till the moming hours, for every house held a knot of eager talkers, and much betel-nut was consumed, and endless were the conjectures what would come of it.

On the second day they left the last village behind them and entered the wild country that surrounds the great mountain, and rested in the huts that had been prepared for them on the banks of a stream of cold and sparkling water. And the Rajah's hunters, armed with long and heavy guns, went in search of deer and wild bulls in the surrounding woods, and brought home the meat of both in the early morning, and sent it on in advance to prepare the mill-day meal. On the third day they advanced as far as horses could go, and encamped at the foot of high rocks, among which uarrow pathways only could be found to reach the mountain-top. And on the fourth morning when the Rajah set out, he was accompanied ouly by a small party of priests and princes with their immediate attendants; and they toiled wearily up the rugged way, and sometimes were carried by their servants, till they passed up above the great trees, and then among the thorny bushes, and above them again on to the black and burnt rock of the highest part of the mountain.

And when they were near the summit the Rajah ordered them all to halt, while he alone went to meet the great spirit on the very peak of the mountain. So he went on with two hoys only who carried his sirih and betel, and soon reached the top of the mountain among great rocks, on the edge of the great gulf whence issue forth continually smoke and vapour. And the Rajah asked for sirilt, and told the boys to sit down under a rock and look down the mountain, and not to move till he returned to them. And as they were tired, and the sun was warm and pleasant, and the rock sheltered them from the cold wind, the boys fell asleep. And the Rajah went a little way on under another rock; and he was tired, and the sun was warm and pleasant, and he too fell asleep.

And those who were waiting for the Rajah thought him a long time on the top of the mountain, and thought the great spirit must have much to say, or might perhaps want
to keep him on the mountain always, or perhaps he had missed his way in coming down again. And they were debating whether they should go and search for him, when they suw him coming down with the two boys. And when he met them he looked very grave, but said nothing ; aul then atl descended together, and the procession retumed as it had come; and the Rajah went to his palace and the chicts to their villages, ant the people to their houses, to tell their wives and chidenen all that had happened, and to womder yet again what would come of it,

And three days afterwards the Rajah summoned the priests and the princes and the chief men of Mataram, to hear what the great spirit had toh him on the top of the mountain. Amb when they were all assembled, and the betel and sirih had been handed romal, he told them what had happened. On the top of the monntain he had fallen into a trance, and the great spirit had appeared to him with a face like bumished wold, and had said-"O Rajah: much plague and sickness and fevers are coming upan atl the earth, upon men and upou horses and upon cattle; but as you and your people have obeyed me and have come up to my great momatain, I will teach you how you and all the people of Lombock may escape this plague." And all waited anxionsly, to hear low they were to be saved from so fearful a calamity. Amb after a short silence the Rajals spoke again and told them,- - that the great spirit had commanded that twolwe sacred lirisses should be made, and that to make them every village and every district must sent a bundle of meedles-a needle for every head in the villaces. And when any grievons disease appeared in any village one of the sacred krissen shomad be sent there; and if every house in that village had sent the right number of needles, the disease would immediately cease; lut if the number of meenlhes sent hat not been exact, the kris would have no virtue.

So the prinees amb chiefs sent to all their villages amd communicated the wonderfil news; and all made haste to conlent the noelles with the greatest acomacy, for they feared that il hut one were wonting the whole village would suffer. So one by one the head men of the villares homeht in their bundles of needles; those who were near

Mataram came first, and those who were far off came last; and the Rajah received them with his own hands, and put them away carefully in au inner chamber, in a camphorwood chest whose hiuges and clasps were of silver; and on every bundle was marked the name of the villagt: and the district from whence it came, so that it might be known that all had heard and obeyed the commands of the great spirit.

Aud when it was quite certain that every village had sent in its bundle, the Rajah divided the needles into twelve equal parts, and ordered the best steel-worker in Mataram to bring his forge and his bellows and his hammers to the palace, and to make the twelve livisses under the Rajah's eye, and in the sight of all men who chose to see it. And when they were finished, they were wrapped up in new silk and put away carefully until they might be wanted.

Now the joumey to the mountain was in the time ol ${ }^{\circ}$ the east wind when no rain falls in Lombock. And soon after the krisses were made it was the time of the rice harvest, and the chiefs of districts and of villages brohorht in their tax to the Rajah according to the mumber of heads in their villages. And to those that wonted but little of the full amount, the Rajah said nothing; but when those came who brought only half or a fouth part of what was strietly due, he said to them mildly, "The needles which you sent from your villare were many more than came from such-a-one's villare, yet your tribute is less than his; go back and see who it is that has not paid the tax." And the next year the produce of the tax increased greatly, for they feared that the Rajuh miglat justly kill those who a second time kept baek the right tribute. And so the Rajah became very rich, and increased the number of his soldiers, and gave golelen jewels to his wives, and bought fine black horses from the whiteskimed Hollonders, and made great feasts when his children were born or were martied; and none of the Rajahs or Sultans among the Malays were so great or so powerful as the Rajah of Lombock.

And the twelve sacred krisses had great virtue. Aum when any sichness ampared in a village one of then was
sent for; and sometimes the sickness went away, and then the sacred kris was taken back again with great honour, and the head men of the village camo to tell the Rajah of its miraculous power, and to thank him. And sometimes the sickness would not go away; and then everybody was convinced that there had been a mistake in the number of needles sent from that village, and therefore the sacred kris lial no effect, and had to be taken back again by the head men with heary hearts, but still with all honour,-for was nat the fault their own?

## Chapter XIII.

## TLMOR.

(COLPAKG, 1857-1850. DELLI, 1861.)

THE island of Timor is about thre humdred miles long and sixty wide, and seens to lirm the termination of the great range of voleanic islands which begins with Sumatra more than two thousand miles to the west. It dithers however very remarkably fom all the oher ishands of the chain in not posessing any active voleanoes, with the one exception of Timor Peak near the centre of the ishat, which was formerly active, but was blown up during an eruption in 1608 and has since been quiescent. In no other part of Timor do there appear to he any recent inneous rocks, so that it can hardly be classed as a volemie island. Inded its position is just outside of the great folmanic helt, which extends from Flores through Ombay and Wetter to Banda.

I first visited Timor in 1857, staying a day at Coupang, the chief Dutch town at the west end of the island; and again in May 1859, when I stayed a fortnight in the same melyhbmurhood. In the spring of 180 L I spent fou* months at Delli, the capital of the Portuguese possessions in the eastern part of the ishad.

The whole neirhboulnod of Coupang appears to have been elevated at a recent epoch, consisting of a rugged surface of coral rock, which rises in a vertical wall between the beach and the town, whose low white red-tiled houses give it an appearance very similar to other Dutch settleuents in the East. The vegetation is everywhere santy and scrubby. Plants of the families $A_{\text {poeynacese and }}$ Euphorbiacere abound ; but there is nothing that can be called a forest, and the whole country has a parchad and desolate appearance, contrasting strongly with the lofty forest trees and perennial verdure of the Molaceas or of Singapore. The most conspicuons feature of the varetation was the abundance of tine fan-leaved palms (fotassus flabellifomis), from the leaves of which are constructel the strong and durable water-huckets in gemeral use and which are much superior to those formed from nny other species of palm. From the same tree, palm-wine and shat are made, and the common thateh for houses formon oif the leaves lasts six or seven years without removal. Close to the town I noticed the foundation of a ruined house below high-water mark, indieating recent subsidence. Earthquakes are not sowere here, and are so infrequent and harmless that the chief louses are built of stome.

The inhabitants of Coupang consist of Malays, Chinese, and Dutch, besides the natives; so that there are mamy strange and complicated mixtures among the pophation. Thare is one resident English merchant, and whalurs as well as Australian ships oftern come here for stores and water. The native Tinorese preponderate, and it very litte examination serves to show that they have nothing is common with Malays, but are much more closely allied to the true Papuans of the Aru Istands and New Guinea. They are tall, have pronounced features, large somewhat aquiline noses, and frizzly hair, and me generally of a dusky brown colour. The way in whith the women talk to each other and to the men, their loud voices aml laughter, and general character of self-assertion, would enable an experienced observer to decide, even without secing them, that they were not Malays.

Mr. Arudt, a German and the Govemment doctor, invited me to stay at his house while in Coupang, and I
gladly accepted his offer, as I only intended making a short visit. We at first began speaking French, but he got on so badly that we soon passed insensibly into Malay; and we atterwards held long discussions on literary, scientific, and philosophical questions, in that semibarbarons language, whose deficiencies we made up by the free use of French or Latin words.

After a few walks in the neighbourhood of the town, I foum such a poverty of insects and birits that I determinel to go for a few days to the island of Semao at the western extremity of Timor, where I heard that there was forest country with birds not found at Conpang. With some difliculty I obtained a large dug-out boat with outriggers, to take me over, a distance of about twenty miles. I found the country pretty well wooded, but covered with shrubs and thomy bushes rather than forest trees, and everywhere excessively parched and dried up by the longcontinned dry season. I stayed at the village of Oeassa, remarkahle for its soap springs. One of these is in the middle of the village, bubbling ont from a little cone of mul to which the ground rises all round like a volcano in miniature. The water has a soapy feel and produces a atrour hather when any greasy substance is washed in it. It contains alkali and iodine, in such quantities as tu destroy all vegetation for some distance round. Close ly the village is one of the finest springs 1 have ever seen, contained in several rocky basins commmieating ly narrow chanels. These have been neatly walled where required and partly leveled, and form fine natural baths. The water is well tasted and clear as crystal, and the hasins are surrounded by a grove of lofty namy-stemmed bayan-trees, which keep them always cool and shady, and add greatly to the picturesque beanty of the scene.

The villaye consists of curims little houses very different from any I have seen elsewhere. They are of an oval figure, and the walls nre made of sticks about four feet high placel close together. From this rises a high conical roof thatelied with grasis, The only opening is a door about three fer: ligh. The people are like the Timorese with frizzly or wavy hair amd of a cenpery hown colour. The better class appar to bave a mixture of some sumbior
race which has much improved their features. I saw in Coupang some chiefs from the island of Savu further west, who presented characters very distiuct from either the Malay or Papuan races. They most resembled Hindoos, having fine well-formed features and straight thin noses with clear brown complexions. As the Bralminical religion once spread over all Java, and even now exists in Bali and Lombock, it is not at all improbable that some natives of India should have reached this island, either by accident or to escape persecution, and formed a permanent settlement there.

I stayed at Oenssa four days, when, not finding any insects and very few new birds, I returned to Compang to await the next mail steamer. On the way I had a narrow escape of being stramped. The deep coffin-like boat was filled up with my bargage, and with verretables cocoa-nuts and other fruit for Coupang market, and when we had got some way across into a rather rough sea, we found that a quantity of water was coming in which we had no means of baling out. This caused us to sink decper in the water, and then we shipped seas over our sides, and the rowers who had before declared it was nothing now became alarmed, and turned the boat rouml to get lack to the coast of Semao, which was not far olf. By clearing away some of the baggage a little of the water could be baled out, but hardly so fast as it came in, ind when we neared the const we found nothing but vertical walls of rock against which the sea was violently beating. We consted along some distance till we fumd a little cove, into which we ran the boat, hauled it on shore, and emptying it found a large hole in the bottom, which had been temporarily stopped up with a plag of cocon-nut which had come out. Hal we been a quarter of a mile further off lefore we discovered the leak, we should certainly have been obliged to throw most of our baggage overboard, and might easily have lost our lives. After we had put all straight and secure we again started, and when we were half-way across got into such a strong current and high cross sen that we were very nearly being swamped a second time, which made me vow never to trust myselt again in such small and miscrable vessels.

The mail steamer dill not arrive for a week, and I occupied myself in getting as many of the birds as I could, and found some which were very interesting. Among these were five species of pirgeons, of as many distinct genera, and most of them peculiar to the island; two parrots-the fine rel-winged broad-tail (Platycercus vulneratus), allied to an Australian species, and a green species of the genus Geoffroyus. The Tropidorhynchus timorensis was as ubiquitous and as noisy as I had found it at Lombock; and the Sphecothera viridis, a curions green oriole, with bare red orbits, was a great acquisition. There were several pretty fiuches, warblers, and Ilycatchers, and anong them I obtained the elegant bue and red Cyomis hyacinthina; but I eannot recognise among my collections the species mentional by Dampier, who seems to have been much struck by the number of small song-birds in Timor. He says: "One sort of these pretty little birds my men called the ringing bird, because it had six notes, and always repeated all his notes twice, one after the other, begiming high and shrill and ending low. The hird was about the bigness of a lark, having a small sharp black lill and blue wings, the head and breast were of at pale red, and there was a hlue streak about its neck." In Semo monkeys are abmant. They are the common hare-lipped monkes (Manacus cynomolgus), which is found all over the western islants of the Archipelago, and may have been introduced by natives, who often carry it abont captive. There are also some deer, but it is not quite certain whether they are of the same species as are found in Java.

I arrived at Delli, the capital of the lortugnese possessions in Timor, on January 12, 1861, and was kindly received by Captain Hart, an Englishman and an old resident, who trades in the produce of the country and cultivates coffee on an estate at the foot of the liils. With him I was introduced to Mr. Geach, a mining-engineer who had been for two years endeavouring to distover copper in sulficient quantity to be worth working.

Delli is a most miserable place compared with even the poorest of the Dutch towns. The houses are all of mud and thatch; the fort is only a mud enclosure; and the
custom-house and church are built of the same mean materials, with no attempt at decoration or even neatness. The whole aspect of the place is that of a poor native town, and there is $n 0$ simn of cultivation or civilization round about it. His Excellency the Governor's house is the only one that makes any pretensions to appearance, and that is merely a low whitewashed cottage or bungalow. Yet there is one thing in which civilization exhibits itself. Officiuls in black and white European costume, and officers in gorgeous uniforms, abound in a degree quite disproportionate to the size or appearance of the place.

The town being surrounded for some distance by swanps and mud-flats is very unhealthy, and a single night often gives a fever to new-comers which not untrequently proves fatal. To avoid this malaria, Captain Hart always slept at his plantation, on a slight elevation about two miles from the town; where Mr. Geach also had a small house, which he kindly invited me to share. We rode there in the evening ; and in. the course of two days my baggage was brought up, and I was able to look about me and see if I could do any collecting.

For the first few weeks I was very unwell and could not go far from the house. The country was covered with low spiny shrubs and acacias, except in a little valley where a stream came down from the hills, where sone fine trees and bushes shaded the water and formed a very plensant place to ramble up. There were plenty of birds about, and of a tolerable variety of species; but very few of them were gaily coloured. Indeed, with one or two exceptions, the birds of this tropical island were hardly so ormmental as those of Great Britain. Beetles were so scarce that is collector might fairly say there were none, as the few obscure or uninteresting species would not repay him for the search. The only insects at all remarkable or interesting were the buttertlies, which, though comparatively fev in species, were sufticiently abundant, and comprised a large proportion of new or rare sorts. The banks of the stream formed my lest collecting-ground, and I daily wandered up and down its shady bed. which about a mile up became rocky and precipitous. Jere I obtained the rare and beautiful swallow-tail butterties, Papilio ænomaus
and P. liris; the males of which are quite unlike each other, and belong in tact to distinct sections of the genus, while the females are so much alike that they are undistinguishable on the wing, and to an uneducated eye equally so in the cabinet. Several other benutiful butterflies rewarded my search in this place; amoug which I may especially mention the Cethosia leschenaultii, whose wings of the deepest purple are borlered with buff in such a manaer as to resemble at first sight our own Camberwell heauty, although it belongs to a different genus. The most abudant butterlies were the whites and yellows (Pieridee), several of which I had already found at Lombock and at Coupang, while others were new to me.

Early in February we made arrangements to stay for a week at a village called Baliba, situated about four miles off on the mountains, at an elevation of 2,000 leet. We took our bagrage and a supply of all necessaries on packhorses ; and though the distance by the route we took was not more than six or seven miles, we were half a day getting there. The roads were mere tracks, sometimes up steep rocky stairs, sometimes in narrow gullies worn by the horses' feet, and where it was necessary to tuck up our legs on our horses' necks to avoid having them crushed. At some of these places the haggage had to be muloaded, at others it was knocked oll. Sometimes the ascent or descent was so steep that it was easier to walk than to cling to our ponies' backs; and thus we went up and down, over bare liills whose surface was coverel with small pebbles and scattered over with Eucalypti, reminding me of what I had read of parts of the interior of Australia rather than of the Malay Archipelayo.

The village consisted of three houses only, with low walls raised a few feet on posts, and very high roofs thatched with grass hanging down to within two or three feet of the ground. A house which was unfinished and partly open at the back was given for our use, and in it we rigged up a table, some benches, and a screen, while an imner enclosed portion served us for a sleeping apartment. We had a splendid view down upon Delli and the sea beyond. The country round was undulating and open, except in the hollows, where there were some
patcizes of forest, which Mr. Geach, who had been all over the eastern part of Timor, assured me was the most luxuriant he lad yet seen in the ishand. I was in lopes of finding some insects bere, but was much disappointer, owing perlaps to the dampness of the chmate; for it was not till the sun was pretty high that the mists eleared away, and by noon we were generally clouded up agan, so that there was seltom more than an hour or two of fittul sunshine. We searched in every direction for hirds and other game, lut they were very scarce. On our way I hal shot the time white-headed pigeon, Ptilonopus cinetus, anil the pretiy little lorikeet, 'Trichoglossus enteles. I got a few more of these at the blossoms of the Lucalypti, and also the allied species Triehoglosins iris, atme a few other small hut interesting birds. The common junglecoek of India (Gallns bankiva) was found here, ant turnished us with some excellent meals ; but we could gret no deer. Potatocs are grown higher up the mountains in aboudance, and are very good. We had a sheep killed every other day, and ate our mutton with much appetite in the cool chimate which rendered a fire always arreeable.

Although one-hall the Eturopean residents in Delli are contimually ill from fever, and the Portugnese have occupted the place for three enturies, no one has yet built a louse on these fine hills, which, if a tolerable road were made, would be only an hour's ride from the town; and almost fqually good situations might he found on a lower level at hiff an hom's distance. 'The fact that potatoes and wheat of excellent quality are grown in abumdance at from 3,1000 to 3,500 feet elevation, shows what the climate and soil are capable of if properly enltivated. From one to two thousand feet high, collee would thrive; and there are humdreds of square miles of country, over which all the varied products which require climates between those of collee and wheat would flourish; but no attempt has yet been made to form a siugle wile of road, or a single acre of plantation !

There must be something very unusual in the ciimate of Timor to permit of wheat being grown at so moderate an elevation. The grain is of excellent quality, the bread made from it being equal to any I have ever tasted; and
it is universally acknowledged to be unsurpassed by any made from imported European or American flour. The fact that the natives have (quite of their own accord) taken to cultivating such foreign articles as wheat and potatoes, which they bring in small quantities on the backs of ponies by the most horrible mountain tracks, and sell very cheaply at the seaside, sufficiently indicates what might he done, if good roaly were made, and if the people were taught, encouraged, and protected. Sheep also do well on the mountains; and a breed of hardy ponies in much repute all over the Archipelago, runs half wild; so that it apmars as if this island, so barren-looking and devoid of the usual features of tropical vegetation, were yet especially adapted to supply a varicty of products essential to Europenas, which the other islands will not produce, and which they aecordingly import from the other side of the globe.

On the 24th of Pelruary my friend Mr. Geach left Timor, having finally reported that no minerals worth working were to be found. The Portuguese were very much annoyed, having mate up their minds that copper is abundant, and still believing it to be so. It appears that from time inmemorial pure native copper has been found at a place on the coast about thirty miles east of Delli. The natives say they find it in the bed of a ravine, and many years ago a captain of a vessel is said to have got some hundreds-weight of it. Now, however, it is evidently very scarce, as during the two years Mr. Geach resided in the country, none was found. I was shown one piece several pounds' weight, having much the appearance of one of the larger Australian nuggets, but of pure copper instead of gold. The matives and the Portuguese have very naturally imagined, that where these fragments come from there must be more; and they have a report or tradition, that a mountain at the bead of the raviue is almost pure copper, and of course of immense value.

After mueh difticulty a company was at length formed to work the copper mountain, a Portugnese merchant of Singapore supplying most of the capital. So confident were they of the existence of the enprer, that they thought it would be waste of time and money to have any exploration made
first; and accorlingly sent to Eugland for a miniugengineer, who was to bring out all necessary tools, machinery, laboratory, utensits, a number of mechanies, and stores of all kinds for two years, in order to commence work on a copper-mine which he was told was already discovered. On reaching Singapore a ship was freighted to take the men and stores to Timor, where they at length arrived after much delay, a long voyauge, and very great expense.

A day was then fixed to "open the mines." Captain Hart accompanied Mr. Geach as interpreter. The Governor; the Commandante, the Judge, and all the chief people of the place, went in state to the momntain, with Mr. Geach's assistant and some of the workmen. As they went up the valley Mr. Geach examined the rocks, but saw no signs of copper. They went on and on, but still nothing except a few mere traces of very poor ore. At length they stood on the copper mountain itself. The Governor stopped, the officials formed a circle, and he then addressed them, saying, -that at length the day had arrived they had all been so long expecting, when the treasures of the soil of Timor would be brought to light,-and much more in very grandiloquent Portuguese ; and concluded by turning to Mr. Geach, and requesting him to point out the best spot for them to begin work at once, and uncover the mass of virgin copper. As the ravines and precipices among which they had passed, and which had been carefully examined, revealed very clearly the nature and mineral constitution of the country, Mr. Geach simply told them that there was not a trace of copper there, and that it was perlectly useless to begin work. The audience were thunderstruck? The Governor could not believe his ears. At length, when Mr. Geach had repeated his statement, the Goveruor told him severely that he was mistaken; that they all knew there was copper there in abundance, and all they wanted him to tell them, as a mining-engineer, was how best to gct at it ; and that at all events he was to begin work somewherc. This Mr. Geach refused to do, trying to explain, that the ravines had cut far deeper into the hill than he could do in years, and that he would not throw away money or time on any such useless attempt. After this
speech had been interpreted to him, the Governor saw it was no use, and without saying a word turned his horse and rode away, leaving my friends alone on the mountain. They all believed there was some conspiracy-that the Englishman woull not find the copper, and that they had been cruelly betrayed.

Mr. Geach then wrote to the Singapore merchant who was his employer, and it was arranged that he should send the mechanics home arain, and himself explore the country for minerals. At first the Government threw obstacles in his way and entirely preventel his moving; but at length he was allowed to travel about, and for more than a year he and lis assistant explored the eastern part of Timor, crossing it in several places from sea to sea, and ascending every important valley, without finding any minerals that would pay the expense of working. Copper ore exists in several places, but always too poor in quality. The best would pay well if situater in Eugland; but int the interior of an utterly barren comintry, with roads to make, and all skilled labour and materials to inaport, it would have been a losing concern. Gold also occurs, but very sparingly and of poor quality: A fine spring of pure petroleum was discovered far in the interior, where it can never be available till the country is civilized. The whole affair was a dreadful disappointment to the Portuguese Government, who had considered it such a certain thing that they hat contracted for the Duteh mail steamers to stop at Delli, and several vessels from Australia were induced to come with miscellaneons cargoes, for which the $y$ expected to find a ready sale among the population at the newly-opened mines. The lumps of native copper are still, however, a mystery. Mr. Geach has examined the country in every direction without being able to trace their origin ; so that it seems probable that they result from the debris of old copper-bearing strata, and are not really more abundant than gold nuggets are in Australia or California. A high reward was offered to any native who should find a picce and show the exact spot where he obtained it, but without effect.

The mountaineers of Timor are a people of Papuan type, having rather slender forms, bushy frizzled hair, and the
skin of a dusky brown colour. They have the long nose with overhanging apex which is so characteristic of the Papuan, and so absolutely unknown among races of Malayan origin. On the coast there has been much admixture of some of the Malay races, and perhaps of Hindoo, as

well as of Portuguese. The general stature there is lower, the hair wavy instead of frizzled, and the features less prominent. The houses are built on the ground, while the mountaineers raise theirs on posts three or four feet high.

The common dress is a long cloth, twisted round the waist and hanging to the knee, as shown in the illustration (page 140 ), copied from a photurraph. Both men carry the national umbrella, matle of an entire fan-shaped palıu leaf, carefully stitched at the fok of each leatlet to prevent splitting. This is opened ont, and bed sloning over the heal and hack daring a shower. The small water-bucket is made from an entire unopened leat of the sime palm, and the coverad hamboo probably contains homey for sale. A curious wallet is generally carried, consisting of a : quare of strongly woven cloth, the four comers of which are connected hy cords, and often much brammented with heads and tassels. Leaning against the house behind the fivire on the right are bamboos, ned instead of water jars.

A prevalent custom is the "pomali," exactly equivalent to the "taboo" of the Pacilic islanders, and equally respected. It is usem on the commonest oceasions, and a few pahn leaves stuck outside a garden as a sign of the "pomali" will preserve its produce from thieves as dffectually as the threatening notice of man-traps, spring gruns, or a savage dog, would do with us. The dead are placed on a stage, raised six or eight feet above the ground, sometimes open and sometimes covered witl a roof. Inere the body remains till the relatives can athord to make a fenst, when it is buried. The Timorese are gencrally great thieves, but are not bloodthirsty. They fishlt contimually among themsplves, and take erery opjurlunity of kidnapping unprotected jeople of other tribes fin slaves; lont Europeans may pass anywhere throurts Whe country in safety. Except a few half-breeds in the town, there are no native Christians in the island of Timor. The people retain their independence in a great acasure, and both dislike aud despise their would-be rulers, whether Portuguese or Dutch.

The Portuguese government in Tlimor is a most miserable one. Nobudy seems to care the least about the improvement of the country, and at this time, alter three hundred years of occupation, there has not leen a mile of road made beyond the town, and there is not a solitary European resident anywhere in the interior. All the Government
officials oppress and rob the natives as much as they can, and yet there is no eare taken to render the town defensible should the 'Timorese attempt to attack it. So iguorant are the military officers, that having received is small mortar and some shells, no one could be found whor knew how to use them; and during an insurrection of the natives (while I was at Delli) the oflicer who expected to be sent against the insurgents was instantly taken ill ! and they were allowed to get possession of an important pass within three miles of the town, where they could defind themselves agrainst ten times the force. The result was that no provisions were brought down from the hills: a famine was imminent, find the Governor hat to semd off to beg for supplies from the Duth Governor of Amboyna.

In its present state Timor is nore trouble than profit to its Dutel and Portuguese rulers, and it will continte to be so unless a different system is pursued. A fuw good roads into the elevated districts of the interior; a conciliatory policy and strict justice towarls the natives, and the introduction of a good system of cudtivation as in Java and Northern Celebes, might yet make Timor a productive aud valuable island. Hice grows well on the marshy flats which often fringe the const, and maize thrives in all the lowlands, and is the common foot of the natives as it was when Danpier visited the island in 1699 . The small quatity of coflee now grown is of very superior quality, and it might be increased to any extent. Sheep thrive, and would always be valuahe as fresh food for whalers and to supply the adjacent islands with mutton, if not for their wool ; although it is probahlu. that on the mountains this product might soon be obtained by judicious breeding. Horses thrive amazingly; aut enough wheat might be grown to supply the whint Archipelago if there were sufficient inducements to the natives to extend its cultivation, and good roads by which it could be cheaply trausported to the coast. Under such a system the natives would soon perceive that European government was advantageous to them. They would berin to save money, and property being rendered secure they would rapidly acquire new wants and new tastes, and
become large consumers of Euronean goods. This would be a far surer source of profit to their rulers than imposts and extortion, and would be at the same time more likely to produce peace and obedience, than the mockmilitary rule which has hitherto proved most ineffective. To inaugurate such a system would however require an immediate ontlay of capital, which neither Dutch nor Portuguese seem inclined to make,-and a number of honest and energetic officials, which the latter nation at least seems unable to produce; so that it is much to be feared that Timor will for many yen's to come remain in its present state of chronic insurrection and misgovernment.

Morality at Ibelli is at as low an ebb as in the far interior of Brazil, and crimes are connived at which would entail infamy and criminal prosecution in Europe. While I was there it was generally asserted and believed in the place, that two officers had poisoned the hushands of women with whom they were carrying on intrignes, and with whom they immediately cohabited on the death of their rivals. Yet no one ever thought for a moment of showing disapprobation of the crime, or even of considering it a crime at all, the lusbands in question heing low halfcastes, who of course ought to make way for the pleasures of their superiors.

Judging from what I saw myself and by the descriptions of Mr. Geach, the indigenous veretation of Timor is poor and monotonous. The lower ranges of the hills are everywhere covered with serubly Euealypti, which only occasionally grow into lofty forest trees. Mingled with these in smaller quantities are acacias and the fragrant sandalwool, while the higher mountains, which rise to about six or seven thousand feet, are either covered with coarse grass or are altogether barren. In the lower grounds are a varicty of weedy bushes, and open waste places are covered everywhere with a nettle-like wihl mint. Here is fonnd the beantiful cromn lily, Glotiosa superha, winding among the bushes, and displaying its magnifient blossoms in great profusion. A will vine also oceurs, bearing great irregular honches of hairy grapes of a conse but very luscious flawour. In some of the valleys where the
vegetation is richer, thorny shrubs and climbers are so abundant as to make the thickets quite impenetrable.

The soil seems very poor, consisting chiefty of decomposing clayey shales; and the bare earth and rock is almost everywhere visible. The drought of the hot season is so severe that most of the streams dry up in the plains before they reach the sea; everything becomes burnt up, and the leaves of the larger trees fall as completely as in our winter. On the mountains from two to four thousand feet elevation there is a much moister atmosphere, so that potatoes and other European products can be grown all the year round. Besides ponies, almost the only exports of Timor are sandal-wood and becs'-wax. The sandal-wood (Santalum sp.) is the produce of a small tree, which grows sparingly in the mountains of Timor and many of the other islands in the far East. The wood is of a fine yellow colour, and possesses a well-known delightful fragrance which is wonderfilly permanent. It is brought down to Delli in small $\log s$, and is chielly exported to Chiua, where it is largely used to burn in the temples, and in the honses of the wealthy.

The bees'-wax is a still more important and valuable product, formed by the wild bees (Apis dorsata), which build huge honeycombs, suspended in the open air from the under-side of the lofty branches of the highest trees. These are of a semicircular form, and often three or four feet in liameter. I once saw the natives take a bees" nest, and a very interesting sight it was. In the valley where I used to collect insects, I one day saw three or four Timorese men and boys under a high tree, and, looking up, saw on a very lofty horizontal branch three large bees' combs. The tree was straight and sinoothbarked and without a branch, till at seventy or eighty feet from the ground it gave out the limb which the bees had chosen for their home. As the men were evidently looking after the bees, I waited to watch their operations. One of them first produced a long piece of wood apparently the stem of a smatl tree or creeper, which he had brought with him, and began splittine it through in several directions, which showed that it was very tough and stringy. He then wrapped it in paln-leaves, which were secured
by twisting a slender creeper round them. He then fistened his cloth tightly round his loins, and producing another choth wrapped it round his head, neek, and body, and tied it firmly round his neck, leaving his face, arms, and lems completely bare. Slung to his girdle he carried a long thin coil of cord; and while he had been making these preparations one of his companions had cut a strong crecper or bush-rope eight or teri yards long, to one end of which the wool-torch was fastened, aul lighted at the buttom, emitting a steady stream of smoke. Just above the torch a chopping-knife was fastened by a short cord.

The bee-hunter now took hold of the bush-rope just above the toreh and passed the other end round the trunk of the tree, holding one end in each hand. Jerking it up the tree a little above his head he set his foot against the trunk, and leaning back legran walking up it. It was wonderful to see the skill with which he took advantage of the slightest irregularities of the bark or obliguity of the stem to aid his ascent, jerking the stiff creeper a few feet higher when he latd found ia firm hold for his bare foot. It alnost made me giday to look at him as he rapidly got up-thirty, forty, bifty feet above the ground; and I kept wondering how he could possibly mount the next few feet of straight smooth trunk. Still, however, he kept ou with as much coolness and apprent certainty as if he were goiug up a ladder, till he got within ten or fifteen feet of the bees. Then he stopped a moment, and took care to swing the torch (which hung just at his feet) a little towarls these dangerous insects, so as to send up the stream of smoke between him and them, Still going on, in a minute more he brought himself under the limis and, in a manner quite uninteligible to me, seeing that both hands were ocemped in supporting himself by the creeper, managed to get upon it.

By this time the bees began to be alamed, and formed a dense buzzing swarm just over him, but he brought the turch ur closer to him, and coolly brusked away those that settled on his arms or legs. Then stretching himself along the limb, he crept towards the nearest comb and swung the toreh just under it. The moment the smoke touched it, its colour changed in a most curious
manuer from black to white, the myrinds of bees that had covered it flying off and forming a dense clond above and around. The man then lay at full length along the limb, and brushed off the remaining bees with his hand, and then drawing lis knife cut off the comb at one slice close to the tree, and attaching the thin cord to it, let it down to his companious below. IIe was all this time enveloped in a crowd of angry bees, and how he bore their stings so coolly, and went on with his work at that giddy height so deliberately, was more than I could understand. The bees were evidently not stupified by the smoke or driven away far by it, and it was impossible that the small stream from the torch could protect his whole body when at work. There were three other combs on the same tree, and all were successively taken, and furnished the whole party with a luscious feast of honey and young bees, as well as a valuable lot of wax.

After two of the combs had been let down, the bees became rather numerous below, flying abont wildy and stinging vicionsly. Several got about me, aud I was soon stung, and hed to run away, beating them off with my net and capturing them for specimens. Several of them followed me for at least half a mile, getting into my hair and persecuting me most pertinaciously, so that I was more astonished than ever at the immunity of the natives. I am inclined to think that slow and deliberate motion, and no attempt at escape, are perhaps the best safeguards. A bee settling on a passive native probably behaves as it would on a tree or other inanimate substance, which it does not attempt to sting. Still they must often suffer, but they are used to the pain and learn to bear it impassively, as without doing so no man could be a beehuater.

## CHAPTER XIV.

THE NATURAL HISTORY OV THE THMOR GROEP.

IF we look at a map of the Archipelago, nothing seens more unlikely than that the clusely comected chain uf islands from Java to 'limor should difier materially in their natural productions. 'There are, it is true, certain difterences of climate and of physical geography, but these do not correspond with the division the naturalist is obliged to make. Between the two ends of the chain there is a great contrast of climate, the west being exceedingly moist and laving only a short and irregular dry senson, the east being as dry and parched up, and having but a short wet season. This change, however, occurs about the middle of Java, the eastern portion of that island having as strongly marked seasons as Lombock and Timor. There is also a difference in physical geography; but this ocerrs at the eastern termination of the chain, where the volcanoes which are the marked feature of Java, Bali, Lombock, Sumbawa, and Flores, turn northwards through Gunong $A_{p^{i}}$ to Banda, leaving Timor with only one voleanic peak near its centre; while the main portion of the island consists of old sedimentary rocks. Neither of these physical differences corresponds with the remarkable change in natural productions which occurs at the Straits of Lombock, separating the island of that name from Bali; and which is at once so large in amount and of so fimdamental a character, as to form an important feature in the zoological geography of our globe.

The Dutch naturalist Zollinger, who resided a long time in the island of Bali, informs us that its productions campletely assimilate with those of Java, and that he is not aware of a single animal found in it which does not inhabit the larger jsland. During the fuw days which I stayed on the north const of Bali on my way to Lombook, I saw several birds highly characteristic of Javan ornithology. Among these were the yellow-headed weaver
(Ploceus hyposanthus), the black grasslopper thrush (Copsychus amonus), the rosy barbet (Megatiema rosea), the Malay oriole (Oriolus horsfieldi), the Java ground starling (Sturnopastor jalla), and the Javanese thre-toed woodpecker (Chrysonotus tiga). On crossing over to Lombock, sequated from Bali by a strait less than twenty miles wide, I naturally expected to meet with some of these birds again; but during a stay there of three months I never saw one of them, but found a totally tiliment set of species, most of which were utterly unknown not. ouly in Java, but also in Borneo, Sumatra, ind Malacea. For example, among the commonest birds in Lombock were white cockatoos and three species of Meliphagide or honeysuckers, belonging to family groups which are entirely absent from the western or Indo-MLalayan region of the Archipelago. On passing to Flores and Timor the distinctness from the Javanese proluctions increases, and we find that these islands form a matural group, whose hiris are related to those of Java and Australia, but are quite distinct from either. Besides my own collections in Lombock and Timor, my assistant Mr. Allen made a goond collection in Flores; and these, with a dew species obtained by the Dutch naturalists, enable us to form a very good idea of the natural history of this group of islands, and to derive therefrom some very interesting results.

The number of birds known from these islands up to this date, is,- 63 from Lombock, 86 from Flures, and 118 from Tinor; and from the whole group 188 species. With the exception of two or three species which appear to have been derived from the Molnceas, all these birds can be traced, either directly or by close allies, to Java on the one side or to Australia on the other; although no less than 82 of them are found nowhere out of this small group of islands. There is not, however, a single geaus peculiar to the group, or even one which is largely represented in it by peculiar speeies ; and this is a fact which indicates that the fauna is strictly derivative, and that its origin does not go lack beyond one of the most recent geological epochs. Of courso there are a latge number of speries (such as most of the waders, many of the raptorial birds, some of the kingtishers, swallows, and a few others), which rame so widely
over a large part of the Arehipelago, that it is impossible to trace them as having come from any one part rather than from another. There are fitty-seven such species in my list, and besides these there are thirty-five more which, thongh peeulia to the Timor group, are yet allied to wideranging forms. Deducting these ninety-two species, we have nearly a hundred birds left whose relations with those of other comitries we will now consider.

If we first take those species which, as far as we yot know, are absolutely confined to each jsland, we find, in-

The actual number of peculiar species in ench island I do wot suppe to the at all aceurately determinen, since the rapidly increasing mumbers evidently depend upon the more extensive collections made in Timor than in Flores, and in Flores than in Lombock; but what we can depent more upon, and what is of more especial interest, is the greatly increased proportion of Australian forms and decreased proportion of Indian forms, as we go from west to east. We shall show this in a yet more striking manner ly countiug the number of species identical with those of "Iava and Australia respectively in each island, thus :

| I | In Lombock | In Flores. 23 | In Tin |
| :---: | :---: | :---: | :---: |
| Austration bi | . . 4 | 5 | 10 |

Here we see flainly the course of the migration which has been going on for lamedreds or thousands of years, and is still going on at the present day. Sirds entering from Java are most numerous in the island nearest Java; each strait of the sea to be crossed to reach another island offers an obstacle, and thus a smaller number get over to the next island. ${ }^{1}$ It will be observed that the number of birds that appear to have entered from Australia is much less than those which have come from Jiva; and we may nt first sight suppose that this is the to the wite sea that

1 The names of all the hirds inhabiting these islands arb to tre foum in the "lrocectings of the Zoological society of loundon" for tho year 1803.
separates Australia from Timor. But this would be a hasty and, as we shall soon see, an unwaranted supposition. Besides these birds ilentical with species inlabiting Jawa and Australia, there are a considerable number of otheris very closely allied to species peculiar to those countries, and we mast take these also into aceomat before we form any conclusion on the matter. It will be as well to conbine these with the former table thus:

| Jamam birts | In Lanboek. | In Flores | $\begin{aligned} & \text { In limur } \\ & 11 \end{aligned}$ |
| :---: | :---: | :---: | :---: |
| Closely nlitied to Javan birils | . 1 | 5 | $6_{6}$ |
| Total | 34 | 28 | 17 |
| Anstralian hirds | . 4 | 5 | 10 |
| Closely allied to Anstralian bird | ds | 9 | 26 |
| Total | . 7 | 14 | 86 |

We now see that the total mminer of binds which sectn to have been derived from Java and Australia is very nearly equal, but there is this remarkable difference between the two series: that whereas the larger propartion by far of the Java set are identical with those still inhabiting that country, an almost equally large proportion of the Australian set are distinct, though often very closely allied species. It is to be observed also, that these representative or allied species diminish in mumber as they recede from Australia, while they increase in number as they recedn fiom Tava. There are two reasons for this, one being that the islands decrease rapidly in size from Timor to Lomboek, and can therefore support a decreasing number of shecies; the other and the more important is, that the distance of Australia from Timor cuts ofl the supply of fresh immigrants, and has thus allowed variation to have full play; while the vieinity of Lombock to Bali and Java has allowed a continual influx of fresh individuals which, by crossing with the earlier immigrants, has checked variation.

To simplify our view of the derivative origin of the birds of these islands let us treat them as a whole, and thus perhaps render more intelligible their respective relations to Java and Australia.

The Timor group of islands contains :-

We have here a wonderful agreenent in the atmber of birds belonging to Australian and Javanese groups, hut they are divided in exactly a reverse mamer, three-fouthe of the Javan birds being identical species and one-fourth representatives, while only one-fourth of the Austratian forms are identical and thee-fourths representatives. Thas is the most important lact which we can elicit fiom a study of the birls of these islands, shee it gives us a very complete che to much of their past history.

Change of species is a slow process. On that we are all agred, though we may differ about how it has taken place. The fact that the Australian species in these islands lave mostly changed, while the Javan species lave ahmost all remamed unchangel, would therelure indicate that the district was first peopled from Australia. Put, for this te have been the case, the physical conditions must have been very difierent from what they are now. Neary three humdred miles of open sea now separate Australia from Timor, which island is connected with Java by a cham of broken lam divided by straits which are nowhere more than about twenty miles wide. Evidently there are now great facilities for the natmal productions of Java to spread over and occupy the whole of these islands, while those of Australia would find very great dificiculty in gettiug across. To account for the present state of things, we should naturally suppose that Australia was once much nore closely connected with Timor than it is at present; and that this was the case is rendered highly probable by the fact of a submarine bank extending along all the north and west coast of Australia, and at one place approaching within twenty miles of the coast of Timor. This indicates a recent subsidence of North Australia, which probably once extended as far as the edge of this bank, between which and Limor there is an unfathomed depth of ocean.

I do not think that Timor was ever actually commeted
with Australia, hecause such a large mumber of very abumdant and characteristic groups of Australiau birds are quite absent, and not a single Australian mammal has entered Timor; which would certainly not have been the case had the lands been actually united. Such groups as the bower birds (Ptilonorhynchus), the black and red cockiatoos (Calyptorhynchus), the blue wrens (Malurus), the crowshrikes (Cracticus), the Australian shrikes (Falcunculus and Colluricincla), and many others, which aboumd all over Australia, would certainly have spread into Timor if it had heen united to that country, or even if for any long time it had aproached marer to it than twenty miles. Neither do may of the most clanacteristic groups of Australian inseets oceur in Timor; so that everything combines to indieate that a strait of the sea has always separated it from Anstralia, lout that at one promod this, strait was reduced to a wilth of ahout twenty miles.

But at the time when this narrowing of the sea took place in one direction, there must have leen a greater separation at the other end of the chain, or we should finul nure equality in the numbers of identical and representative species derived from each extremity. It is true that the widening of the strait at the Australian end by subsidence, would, by putting a stop to immigration and intercrassing of individuals from the mother country, lave allowed full senge to the canses which have led to the tuadifieation of thin species; while the continued stream of immigrants from. Java, wouk, by continal intererossing, check such modification. This view will tot, however, explain all the facts; for the character of the fama of the Timorese group is indicated as well by the forms which are absent from it as by those which it contains, and is ly this kime of evidence shown to be much nore Australian than Indian. No less than twenty-nine genera, all more or less abundant in Java, and most of which moge over a wide area, are altogether alisent; while of the equally diffused Australian genera only about fourteen are wathting. This would clearly indicate that there has been, till recently, a wide separation from Java; and the fact that the islands of Rali and Lombock are small, and are almost wholly voleanic, and contain a smaller number of modifiel
forms than the other islands, wonld print them out as of comparatively recent origin. A wide arm of the sea probably occuphed their place at the time when Timor was in the cosest proximity to Australia; and as the sultermanean fires were slowly piling u, the now fertile islands of Bali and Lomboek, the northern shores of Australia would be sinking benoath the ocean. Some swch changes as have been here imbicated, enable us to mulerstand bow it happens, that though the birds of this group are on the whole almost as much Indian as Anstralian, yet the species which are peculiar to the group are nostly Australian in character; and also why such a large number of common Indian forms which extend through Java to Bali, should not lave transmitted a single representative to the islonds further east.

The Mammalia of Thmor ns well as those of the other islands of the group are exeedingly scanty, with the exception of bats. These last are tolerably abmudant, and bu elond many more remain to be discovered Out of fifteen species known from Timor, nine are fomm also in Java, or the ishats west of it three are Molucean species, most of which are also found in Austratia, and the rest are peculiar to Timor.

The land mammals are ouly seven in mumber, as follaws: 1. The common monkey, Macacus cynomolgns, which is fomed in all the Intw-Makayan islands, and has spread from Java through Bali and Lomberk to Timor. This species is very frequent on the banks of rivers, anl may have been conveyed from island to island on trees cartied down by floods. 2. Paradoxmrus fasciatus; a civet cat, rery common over a large part of the Archipelago. 3. Felis megalotis; a tiger cat, said to be peculiar to Timor, where it exists only in the interior, and is very rare. Its nearest allies are in Java. 4. Cervus timoriensis; a deer, closely allied to the Javan and Molncean species, if distinct. 5. A wild pig, Sus timoriensis; perhaps the same as some of the Molucean species. 6. A shrew monse, Sorex tenuis; supposed to be peculiar to Timor. 7. An Eastern opossum, Cuscus orientalis; found also in the Moluccas, if not a distinct species.

The fact that not one of these species is Australian, or
nearly allied to any Australian form, is strongly corroborative of the opinion that Timor has never formed a part of that country; as in that ease some kangaroo or other narsupial animal would ahoost certainly be found there. It is no doubt very dificolt to account for the presence of sume of the few mammals that do exist in Timor, especially the tiger cat and the deer. We must consider, however, that during thousands, and perhaps hundreds of thousands of years, these islands and the seas between them have been subjected to voleanic action. The land has heen raised and has sunk again; the straits have been narrowed or widened; many of the islands may have been joined and dissevered again; violent floods have again and again devastated the mountains ant plains, carryiug out to sea hundreds of forest trees, as has often happened during volcanic eruptions in Java; and it does not seem impubable that once in a thousant, or ten thousand years, there should have oceured such a fivomable combination of eircumstances as would lead to the migration of two or three land animals from one island to another. This is all 1tat we need ask to account for the very scanty and fragmentary groul of Mammalia which now inhabit the large island of Timor. The teer may very probally have heen introduced by man, for the Malays often keep tatme fawns; sund it may not require a thousand, or even five hundred years, to establish new characters in an animal removed to a country so different in climate and vegetation as is Timor from the Moluceas. I have not mentioned horses, which are often thought to be wild in Timos, becanse there are no grounds whatever for such a belief. The Timor ponies have every one an owner, and are quite as much domesticated animits as the cattle on a South American hacienda.

1 have dwelt at some length on the origin of the Timorese fituna, because it appears to me a most interesting and instructive problem. It is very seldom that we can trace the amimals of a district so clearly as we can in this case, to two definite sources; and still more rarely that they furnish such decisive evidence, of the time, and the manner, and the proportions of their introduction. We have here a group of Oceanic Islands in miniature-
islands which have never formed part of the adjacent lands, although so closely approaching them; aud their productions have the characteristics of true Oceanic Islands slightly modificd. These characteristics are, the absence of all Mammalia except bats, and the occurrence of peculiar species of birds, insects, and land shells, which, though found nowhere else, are plainly related to those of the nearest land. Thus, we have an entire absence of Australian mammals, and the presence of only a few stragglers from the west, which can be accounted for in the manner already indicated. Bats are tolerably abundant. Dirds have many peculiar species, with a decided relationship to those of the two nearest masses of land. The insects have similar relations with the birds. As an example, four species of the Papilionida are peculiar to Timor, three others are also found in Java, and one in Australia. Of the four peculiar species two are decided modilications of Javanese forms, while the others seem allied to those of the Moluccas and Celebes. The very few land shells known are all, curionsly enough, allied to or identical with Moluccau or Celebes forms. The Pierida (white and yellow butterflies) which wander more, and from frequenting open grounds are more liable to be blown out to sea, seem about equally related to those of Java, Australia, and the Moluccas.
lt has been objected to Mr. Darwin's theory,-of Oceanic Islands having never been conuected with the mainland,that this would imply that their animal population was a matter of chance; it has been termed the "flotsam and jetsam theory," and it has been maintained that nature does not work by the "chapter of accidents." But in the case which I have here described, we have the most positive evidence that such has been the mode of peopling the islands. Their productions are of that miscellaneous charater which we should expect from such an origin; and to suppose that they have been portions of Australia or of Java will introduce perfectly gratuitous difticulties, and render it quite impossible to explain those curious relations which the best known group of auimals (the birds) have been shown to exhibit. On the other hand, the depth of the surrounding stas, the form of the submerged
banks, and the volcanic character of most of the islands, all point to an independent origin.

Refore concluding, I rust make one remark to avoid misapprehension. When I say that Timor has never formed part of Australia, I refer only to recent geological epochs. In Secondary or even Eocene or Miocene times, Timor and Australia may have been connected; but if so, all record of such a union has been lost by subsequent submergence; and in accounting for the present landinhabitants of any country we have only to consider these changes which have occurred since its last elevation above the waters. Since such last elevation, I feel confident that Timor has not formed part of Australia.

## CHAPTER XV.

## celebes.

(3AACABSAR SETTEMBER TO NOYEMDER, 1856.)

ILEFT Lombock on the 30th of August, and reached Macassar in three days. It was with great satisfaction that I stepped on a shore which I had been vainly trying to reach since February, and where I expected to meet with so much that was new and interesting.

The coast of this part of Celebes is low and flat, lined with trees and villages so as to conceal the interior, except at occasional openings which show a wide extent of bare and marshy rice-fields. A few liills, of no great height, were visible in the background ; but owing to the perpetual haze over the land at this time of the year, I could nowhere discern the high central range of the peninsula, or the celebrated peak of Bontyne at its southern extremity. In the roadstead of Macassar there was a fine 42 -gun frigate, the guardship of the place, as well as a small war steamer and three or four little cutters used for cruising after the pirates which infest these seas. There
were also a few square-rigged trading-vessels, and twenty or thinty native praus of various sizes. I brought letters of introduction to a Dutch gentleman, Mr. Mesman, and also to a Danish shopkeeper, who could both speak English, and who promised to assist me in finding a place to stay at, suitable for my pursuits. In the meantime, I went to a kind of club-house, in default of any lootel in the place.

Macassar was the first Dutch fown I had visited, and I found it prettier and cleaner than any I had yet seen in the East. The Dutch have some admirable local regulations. All European houses must be kept well whitewashed, and every person must, at four in the afternoon, water the road in front of his house. The streets are kept clear of refuse, and covered drains carry away all impuritits into large open sewers, into which the tinle is armitted at higls-water and allowed to flow out when it has ebbed, carrying all the sewarge with it into the sea. The town consists chicfly of one long narrow street, along the seaside, devoted to lusiness, and priacipally occupied by the Dutch and Chinese merchants" offiess and warehouses, and the native shops or bazaars. This extends northwards for more than a mile, gradually merging into native houses, often of a most miserable description, but made to have a neat appearance by leing all built up exactly to the straight nime of the street, and being generally backed by frut trees. This street is usually thronged with a native population of Bugis amd Macassar men, who wear cotton trousers about twelve inches long, covering only from the hip to hald-way down the thigh, and the universal Malay sarong, of gay checked colours, worn round the waist or across the shoulders in a variety of ways. Parallel to this strect run two short ones, which form the old Dutch town, and are enclosed by gates. These consist of private houses, and at their southern end is the fort, the choreh, and a road at right angles to the beach, containing the houses of the Governor and of the principal officials. Beyond the fort again, along the beach, is another long street of native huts and many country houses of the tradesmen and merchants. All mound extend the flat rice-fields, now bare and dry and forbidding, covered with dusty
stubble and weeds. A few months back these were a mass of verdure, and their barren appearance at this season offered a striking contrast to the perpetual erops on the sane kind of country in Lombock and Bali, where the seasons are exactly similar, lut where in elaborate system of irrigation produces the effect of a perpetual, spring.

The day after my arrival I paid a visit of ceremony to the Governor, accompanied by my friend the Danish merchant, who spoke excellent English. His Exechency Was very polite, and offered me every facility for travelling about the country and prosecuting my researches in natural history. We conversed in French, which all Dutch officials speak very well.

Finding it very inconvenient and expensive to stay in the town, I removed at the cond of a week to a little bamboo house, kindly offered me lyy Mr. Mesman. It was situated about two miles away, on a small cotee plantation and farm, and about a mile beyond Mr. M.'s own countryhouse. It consisted of two romus rased about seven feet above the ground, the lower part being partly open fand serving excellently to skin birds in) and partly used as a granary for rice. There was a kitchen and other outhouses, and several cottages near were occupial by men in Mr. ML's employ.

Ater being settled a few days in my new house, I fomml that no collections could be made without going much further into the country. The rice-fichls for some miles round resembled English stubbles late in antumn, and were ahosest as umproductive of bird or insect life. There were several native villages seatered about, so embosomed in fruit trees that at a distance they looked like clumps or patches of forest. These were my only collecting places, but they produced a very limited number of spectes, and were soon exhausted. Before I could move to any more promising district it was necessary to obtain permission from the Rajah of Goa, whose territories approach to within two miles of the town of Macassas. I therefore presented myself at the Governor's oflice and requested a letter to the Rajah, to elaim his protection, and permission to travel in his territories whenever I might wish to do so. This
was immediately granted, and a special messenger was sent with me to carry the letter.

My friend Mr. Mesman kindly lent me a horse, and accompanied me on my visit to the Rajah, with whom he was great friends. We found his Majesty seated out of doors, watching the erection of a new house. He was naked from the waist up, wearing only the usual short trousers and sarong. Two chairs were brought out for us, but all the chiefs and other natives were seated on the ground. The messenger, squatting down at the Rajal's feet, produced the letter, which was sewn up in a covering of yellow silk. It was handed to one of the chief officers, who ripped it open and returned it to the Rajalh, who read it, and then showed it to Mr. M., who both speaks and reads the Macassar language flmently, and who explained fully what I required. Permission was immediately granted me to go where I liked in the territories of Goa, hut the Rajah desired, that should I wish to stay any time at a phace I would first give him notice, in order that he might scod some one to see that no injury was done me. Some wine was then brought us, and afterwards some detestable coffee and wretched sweetmeats, for it is a fact that I have never tasted good coffee where people grow it themselves.

Although this was the height of the dry season, and there was a fine wind all day, it was by no means a healthy time of year. My boy Ali had hardly been a day on shore when he was attacked by fever, which put me to great inconvenience, as at the house where I was staying nothing could be obtained but at meal-times. Alter having cured Ali, and with much difficulty got another servant to cook for me, I was no sooner settled at my country abode than the latter was attacked with the same disease; and, laving a wife in the town, left me. Hardly was he gone than I fell ill myself, with strong intermittent fever every other day. In about a week I got over it, by a liberal use of quinine, when scarcely was I on my legs than Ali again became worse than ever. His fever attacked him daily, but early in the morning he was pretty well, and then managed to cook me enough for the day. In a week I cured him, and also stucceeded in
setting another boy who could cook and shoot, and had no objection to go into the interior. His name was Paderoon, and as he was ummarried and had been used to a roving life, having been several voyages to North Australia to eatch trepang or "hêche de mer," I was in hopes of being able to keep him. I also got hold of a little impudent raseal of "twelve or fourteen, who could spenk some Malay, to carry my gun or insect-net and make himself geneally useful. Ali had by this time become a pretty good birdskinner, so that I was farly supplied with servants.

I made many excursions into the country, in satreh of a frood station for collecting hirds and insects. Some of the villages a few miles inlaud are scattered about in wooly around which has once been virgin torest, but of whichs the constituent trees have been for the most part rephaced by fruit trees, and particularly by the large patm, Arengat sacehatifera, from which wine and sugar are made, and which also produces a coarse black fibre used for cordage. That necessary of life, the bamboo, has atso been abundantly planted. In such places I found a good many brirds, among which were the fine cream-coloured pigeon, Carpophtiga luchosa, and the rare blue-headed roller, Corachas temmincki, which has a nost discordant voice, and generally goes in pairs, lifing from tree to tree, and exhibiting while at rest that all-in-a-heap appearance and jerking motion of the head and tail which are so characteristic of the great Fissirostral group to which it belongs. From this habit alone, the kingtishers, bee-caters, rollers, trogons, and South American puff-birds, might he grouped tugether by a person who had observed them in a state of nature, but who had never had an opportunity of examioing their form and structure in detail. Thonsands of crows, rather smaller than our rook, keep up a constant "awing in these plantations; the curions wood-swallows (Artami), which closely resemble swallows in their habits and flight but differ much in form and structure, twitter from the tree-tops; while a lyre-tailed drongo-shrike, with brilliant black plumage and milk-white eyes, continually deceives the maturalist by the variety of its unmelodious notes.

In the more shady parts butterlies were tolerably
ahumlant; the most common being species of Euplea and Ihanis, which frequent gardens and shrubberies, and owing to their weak flight are easily captured. A beautiful pale hlue and back butterdy, whioh flutters along near the ground among the thickets, and settles oceasionally upon flowers, was one of the most striking; and scarcely less so, was one with a rich orange land on a blackish ground : these hoth belong to the liferide, the group that contains our common white buttertlies, although differing so moth from them in appearance. Both were quite new (1) Furopem maturalists. ${ }^{1}$ Now anl then I extended my walks sume miles further, to the only pateh of true forest 1 comd lind, nccompanied by my two beys with gras and insert-nct. We used to start early, taking our breakfast with us, and eating it wherever we conhl find shade and water. At such times my Macassar boys would put a mimute fragment of rice and meat or fish on a leaf, and lay it on a stome or stump as an offering to the deity of the spot: for though nominal Malmuetans the Macassar people retain mary pagan superstitims, and are but lax in their religions olservances. Pork, it is trae, they hold in abhorence, but will not refuse wine when offered them, and consume immense quantities of "sagueir," or palmwine, which is alrout as intoxicating as ordinary beer or cider. When well made it is a very refreshing drink, and we often took a drumht at some of the little sheds dignified by the mame of bazaars, which are scattered about the country wherever there is any traflic.

One rlay Mr. Mesman told me of a larger piece of forest where he sometimes went to shoot deer, but he assured me ir was much further off, and that there were no birds. Lowever, I resolved to explore it, and the next morning at fire oblock we started, carying our breakfast and some nther provisions with us, and intending to stay the night at a house on the horders of the wool. To my surprise two hours' hard walking brought us to this honse, where we ubtaned permission to pass the night, We then walked on, Ali and baderoon with a gun cach, Baso carrying our provisions and my insect-box, while I took only my net and collectins-bothe and determinel to devote myself

[^4]wholly to the insects. Scarcely had I entered the [orestr when I found some beatiful little green and gold speckled weevils allied to the genus Pachyrhynchus, a group which is almost confined to the Philippine Islands, and is quite unknown in Bornco, Java, or Malacea. The roal was shady and apparently much troddeu by horses and cattle, and I quickly obtained some butterliies I had not before met with. Suon a counle of reports were heard, and coming up to my hoys I found they had shot two specimens of one of the finest of known cuckoos, lhouicophans callirhynchus. This bind derives its name from its large bill being coloured of a brilliant yellow, red, and black, in about equal proportions. The tail is exceedingly loner, and of a tine metallic purple, while the plunage of the body is light coffee brown. It is one of the characteristic birels of the istand of Celebes, to which it is contined.

After santering along for a couple of hours we reached a small river, so deep that horses could only cross it by swimming, so we had to turn lack; but as wo were getting hungry, and the water of the almost stagnant river was too muddy to drink, we went towards a house a fow hundred yards off. In the plantation we saw a small raised hot, which we thought would do well for us to breakfast in, so I entered, and found inside a young womn with an infint. She handed me a jug of water, but looked very much frightened. However, 1 sat down on the doorstep, and asked for the provisions. In handing them up, Baderoon saw the infint, and started back as if he had seen a serpent. It then immediately struck me that this was a lut in which, as among the Dyaks of Bomeo and many nther savage tribes, the women are sechuded for some: time after the liath of their child, and that we did very wrong to enter it; so we walked off and asked lermission to eat our breakfast in the family mansion close at hand, which was of course granted. While I ate, three men, two women, and four chiddren watehed every motion, and never took eyes off me till I had finished.

On our way baek in the heat of the day I haul the good fortune to capture three specimens of a fine Ornithoptera, the largest, the most perfect, and the most beantiful of buttertlies. I trembled with excitement is I took the first
out of my net and found it to le in perfeet condition. The ground colour of this superb insect was a rich shining bronzy black, the lower wings delicately grained with white, and bordered by a row of large spots of the most brilliant satiny yellow. The body was marked with shaded spots of white, yollow, and fiery orange, white the head and Horax were intense black. On the under-side the lower wings were satiny white, with the marginal spots half black and half yellow. I gazed uron my prize with extreme interest, as I at first thought it was quite a new species. It proved however to be a variety of Ornithoptera remus, no of the rarest and inost remarkable species of this highly esteemed group. I also obtained several other new and pretty hutterties. When we arrived at our lodginghonse, being particularly anxious about my insect treasures, I suspended the box from a banboo on which I could detect no sign of ants, and then began skinning some of my birds. During my work I often glanced at my precious box to see that no intruders had arrived, till after a louger grell of work than usual I looked again, and saw to my homor that a column of small red ants were descending the string and entering the box. They were already busy at work at the bodies of my treasures, and another hati-hour would have seen my whole day's collection destroyed. As it was, I had to take every insect out, elean them thoroughly as well as the box, and then seck for a place of satety for them. As the only effectual one I beged a plate and a basin from my host, filled the former with water, and standing the latter in it placed my box on the top, and then felt secure for the night; a few inches of clean water or oil being the only barrier these terrible pests are not able to pass.

On returning home to Mamajann (as my house was called) I had a slight return of intermittent fever, which kept me some days indoors. As soon as I was well, I again went to Goa, accompanied by Mr. Mesman, to leg the lajah's assistance in getting a small honse built for me near the forest. We found him at a cock-fight in a shed near his palace, which however he immediately left to receive us, and walked with us up an inclined plane of boards which serves for stairs to his house. This was large,
well built, and lofty, with bamboo floor and glass windows. The greater part of it seemed to be one large hall divided by the supporting posts. Near a window sat the Queen, squatting on a rough wooden arm-chair, chewing the everlasting siril and betel-nut, while a brass spittoon by her side and a sirih-box in front were ready to administer to her wants. The Rajah seated himself opposite to her in a similar chair, and a similar spittoon and sirih-box were held by a little boy squatting at his side. Two other chairs were brought for us. Several young women, some the Rajah's daughters, others slaves, were standing about; a few were working at frames making sarongs, but nost of them were idle.

And here I might (if I followed the example of most travellers) launch out into a glowing description of the charms of these damsels, the elegant costumes they wore, and the gold and silver ornaments with which they were adorned. The jacket or body of purple gauze would figure well in such a description, allowing the heaving bosom to be seen beneath it, while "sparkling eyes," and "jetty tresses," and "tiny feet" might be thrown in profusely. But, alas! regard for truth will not permit me to expatiate too admiringly on such topics, determined as I am to give as far as I can a true picture of the people and places I visit. The priucesses were, it is true, sulficiently good-looking, yet neither their persons nor their garments had that appearance of freshoss and cleanliness without which no other charms can be contemplated with pleasure. Everything had a dingy and faded appearance, very disagreeable and umroyal to a European eye. The only thing that excited some degree of admiration was the quiet and dignified manner of the hajah, and the great respect always paid to him. None can stand erect in his presence, and when he sits on a chair, all present (Europeans of cousse excepterl) squat upon the ground. The highest seat is literally, with these people, the place of honour and the sign of rank. So unbending are the rules in this respect, that when an English carriage which the Rajah of Lombock had sent for arrived, it was found impossible to use it because the driver's seat was the highest, and it had to be kent as a show in its coach-
house. On being told the object of my visit, the Rajah at once said that he would order a house to be emptied for me, which would be much better than building one, as that would take a good deal of time. Bad coffee and sweetmeats were given us as before.

Two days afterwards I called on the Rajah, to ask him to send a guide with me to show me the house I was to nceupy. Tte immediately ordered a man to be sent for, gave him instructions, and in a few minutes we were on our way. My conductor conld speak no Malay, so we walked on in silence for an hour, when we turned into a pretty good house and I was asked to sit down. The head man of the district lived here, and in about half an hous we started again, and another hour's walk brought us to the village where I was to be lodged. We went to the residunce of the village chicf, who conversed with my conductor for some time. Getting tired, I asked to be shown the house that was prepareal for me. but the only reply I could get was, "Wait a little," aud the parties went on talking as before. So I told them I could not wait, as I wanted to see the louse and then to go shooting in the forest. This seemed to puzzle them, and at length, in answer to questions, very poorly exphained by one or two bystanders who knew a little Mialay, it came out that no house was ready, and no one seemed to have the least idea where to get one. As I did not want to trouble the Rajah any more, I thought it best to try to frighten them a little; so I told them that if they did not immediately lind me a house as the Ratjah had ondered, I should go back and complain to him, but that if a house was found me I would pay for the nse of it. This had the desired effect, and one of the head ruen of the village asked me to go with him and look for a house. He showed me one or two of the most miserable and minous deseription, which I at once rejected, saying, "I must have a good one, and near to the forest." The next he showed ne suited very well, so I told him to see that it was emptied the next day, for that the day after I should come and oceupy it.

On the day mentioned, as I was not quite ready to go, I seut my two Macassar boys with brooms to sweep out the bouse thoroughly. They returmed in the evening and told
me, that when they got there the house was inhabited, and not a single article removed. However, on hearing they had come to clean and take possession, the occupants made a move, but with a good deal of grumbling, which made me feel rather uneasy as to how the people gencrally might take my intrusion into their village. 'lise next morning we took our baggage on three pack-liorses, and, after a fow break-downs, arrived about noon at our des. tination.

After getting all my things set straight, and having made a hasty meal, I determined if possible to make friends with the people. I therefore sent for the owner of the house and as many of his acquaintances as liked to come, to have a "bitchara," or talk. When they were all seated, I gave them a little tobacco all round, and having my boy Baderoon for interpreter, tried to explain to thern why I came there; that I was very sorry to turn them out of the house, but that the lajal had ordered it mather than buikl a new one, which was what I had asked for, and then placed five silver rupees in the owner's hand as one month's rent. I then assured them that my being there would be a benefit to them, as I should buy their eggs aud fowls and fruit; and if their children would bring me shells and insects, of which I showed them specimens, they also might carn a good many coppers. After all this had been fully explained to them, with a long talk and discussion between every sentence, I could see that I had made a favourable impression; and that very afternoon, as if to test my promise to buy even miserable little snail-shells, a dozen children came one after another, bringing me'a few specimens each of a small Helix, for which they duly received "coppers," and went away amazed but rejoicing.

A few days' exploration made me well acquainted with the surrounding country. I was a long way from the road in the forest which I had first visited, and for some distance round my house were old clearings and cottages. I fond a few good buttertlies, but heetles were very scarce, and even rotten timber and newly-felled trees (genemlly so productive) here produced scarcely anything. This convinced me that there was not a sufficient extent of forest in the neighbourhood to make the place worth staying at
long, but it was too late now to think of going further, as in about a month the wet season would begin; so I resolved to stay here and get what was to be had. Uufortumately, after a few days I became ill with a low fever which produced excessive lassitule and disinclination to all exertion. In vain I endeavoured to shake it oft; all I could do was to stroll quietly each day for an hour about the gardens near, and to the well, where some good insects were occasionally to be found; and the rest of the day to wait quietly at lome, and receive what beetles and shells my little corps of collectors brought me daily. I imputed my illness chicily to the water, which was procured from shallow wells, around which there was almost always a stagnant puddle in which the buffaloes wallowed. Close to my house was an inclosed mudhole where three buffaloes were shut up every night, and the eflluvia from which freely entered through the open bamboo floor. My Malay hoy Ali was aflected with the same illness, and as le was my chief bird-skinner I got on but slowly with my collections.

The occupations and mode of life of the villagers differed hut little from those of all other Malay races. The time of the women was almost wholly occupied in pounding and cleaning rice for daily use, in bringing home firewood and water, and in cleaning, dyeing, spinning, and weaving the native cotton into sarongs. The weaving is done in the simplest kind of frame stretched on the floor, and is a very slow and tedions process. To form the checked patienn in common use, each pateh of coloured threads has to be pulled up separately by hand and the shuttle passed between them; so that about an inch a day is the usual progress in stuff a yard and a half wide. The men cultivate a little sirih (the pungent pepper leaf used for chewing with batel-nut) and a few vegetables; and once a year rudely pluigh a small patch of ground with their buffaloes and plant rice, which then requires little attention till harvest time. Now and then they have to see to the repairs of their houses, and make mats, baskets, or other domestic utensils, but a large part of their time is passed in idleness.

Not a single person in the village could speak more
than a few words of Malay, and hardly any of the people appeared to liave seen a European before. One most disagrecable result of this was, that I excited terror alike in man aud beast. Wherever I went, dogs barked, chiddren screamed, women ran away, and men stared as thongh I were some strange and terrible camibal monster. Even the pack-horses on the roads and paths would start aside when I appeared and rusl into the jungle; and as to those horrid, ugly brutes, the buffaloes, they could never be approached by me; not for fear of my own but of others' safety. They would first stick out their neeks and stare at me, and then on a nearer view break loose from their halters or tethers, and rush away helter-skelter as if a demon were after them, without any regard for what might be in their way. Whenever I met buffaloes carrying packs along a pathway, or being driven home to the village, I had to turn aside into the jungle and hide myself till they had passed, to avoil a catastrophe which would increase the dislike with which I was already regarded. Every day about noon the buffalues were brought into the village and were tethered in the shade around the houses; and then I had to creep about like a thief by back ways, for no one could tell what mischief they might do to children and houses were I to wall among them. If 1 came suddenly upon a well where women were drawing water or childreu bathing a sudden flight was the certain result ; which things ocemring day after day, were very unpleasant to a person who does not like to be disliked, and who had never been accustomed to be treated as an ogre.

About the middle of November, finding my health no better, and insects, birds, and shells all very scarce, I determined to return to Manajam, and pack up my collections before the heavy rains commenced. The wind had already begun to blow from the west, and many signs indicated that the rainy season might set in earlier than usual ; and then everything becomes very damp, and it is almost impossible to dry collections properly. My kind friend Mr. Mesman again lent me his pack-horses, and with the assistance of a fow men to carry my birds and insects, which I did not like to trust on horses' backs, we got everything lome safe. Few can imagine the luxury it was
io stretch myself on a sofa, and to take my supper comfortably at dable seated in my casy hamboo chair, alter having for five weaks taken all my meals uncomfortaldy on the floor. Such things are trifles in health, but when the body is weakened by disease the habis of a lifetime camot be so easily set aside.

My house, like all bamboo structures in this country, was a leaning ome, the strong westerly winds of the wet senson having set all its posts out of the perpendicular to suel a dergree, is to make me think it minht some day jussibly go over altomether. It is a remamable thing that the natives of Celebes have not liseovered the use on" hlagonal struts in strengthening buidings. I doubt if there is a native house in the country two years old and at all exposed to the wind, which stands mpright; and mo wonder, as they merely consist of posts and joists all Waced upright or horizontal, and fastence rudely together with rattans. They may be seen in every stare of the frocess of thmbling down, from the firet slight inclination, to sucla a dimgerous slope that it becones a notice to innit to the occupiers.

The mechanical geuiuses of the comitry have only discovered two ways of remedying the evil. One is, alter it has commenced, to tie the house to a post in the ground on the windward side by a rattan or bamboo eable. The other is a preventive, but how they ever found it out and did not discover the true way is a mystery. This phan is, to build the house in the usual way, but iustead of having all the prineipal supports of straight posts, to have two of three of them chosen as crooked as possible. I had often noticed these crooked posts in houses, but imputed it to the scarcity of good straight timber, till one day I met some men carrying home a post shaped something like a dog's hind leg, and inquired of my native boy what they were groing to do with such a piece of wood. "To make a Inst for a lonse," said he. "But why don't they get a straight one, there are plenty here ?" said I. "Oh," rephed he, "they prefer some like that in a house, because then it won't fall," evidently imputing the effect to some occult property of crooked timber. A little consideration and a diagran will, however, show, that the effect imputed
to the crooked post may be really produced by it. A true square changes its figure readily into a rhomboid or oblique figure, but when one or two of the uprights are bent or sloping, and placed so as to oppose each other, the effect of a strut is produced, though in a rude and clumsy mamer:

Just hefore I hat left Mamipun the people hod sown a considerable quantity of maize, which appears above ground in two or three days, and in favourable seasons ripens in less than two months. Owing to a week's premature rains the ground was all flooded when I returned. and the plants just coming into ear were yellow and deal. Not a grain would be obtained by the whole village, but luckily it is only a luxury, not a necessary of life. The

rain was the signal for ploughing to begin, in order to sow rice on all the flat lands between us amd the town. 'The plough used is a rude wooden instrument with a very short single handle, a tolerably well-shaper coultm, and the point formed of a plece of hard palm-wood tastened in with wedges. One or two buffaloes draw it at a very slow pace. The seed is sown brondeast, and a rude wooden larrow is used to smonth the surline.

By the beginning of December the regular wet season had set in. Westerly winds and driving rains sometimes contimued for days together; the fields for miles around were under water, and the ducks and huffaloes enjoyen themselves anazingly, Al alony the road to Macassar,
ploughing was daily groing on in the mud and water, through which the woolen plongh easily makes its way, the ploughman hobling the plotgh-handle with one hand while a long hambon in the uther serves to guide the hoftaloes. These animals require an immense deal of driviug to get them on at all ; a continual shower of exclamations is kept up at them, and "Oh! ah! gee. unh:" are to be heard in varions keys and in an tuninterrupted sucession all day long. At night we were favoured with a different kind of concert. The dry ground around my house hou beome a manh tenanted by frogs, who lept up a most increable noise from dusk to dawn. They were som what imsical too, having a leep vibrating note which at tines closcly resembles the funing of two or three bass-viols in an orehestra. In Malacea and Burneo I had heard no such somots as these, which indicates that the frogs, like most of the ammals of Celebes, are of species peculiar to it.

My kind friend and lamilord, Mr. Mesman, was a gomd specimen of the Macassar-born Dutchman. He was about thirty-five years of age, han a large family, and lived in th spacious house near the town, situated in the midst of a grove of fruit trees, and surrounded by a periect labyrintly of oftices, stables, and native cottages occupied by his numerous servants, slaves, of henemdants. He usually rose hefore the sun, and after a cup of coffee looked after his scrvants, horses, and thags, till seven, when a sulslantial breakiast of rice and ment was realy in a cool veradah. l'utting on a cluan white linen suit, he then drove to town in his buany, where he had an office, with two or three Chinese clerks who looked atter his aflairs. Ilis business was that of a coffee and opium merchant. He hall a coffec estate at Bontyne, aud a small prau which traded to the lastern islands near New Guinea, for mother-af-pearl and tortoiscshell. About one he would return home, have coftee and cake or Pried plantain, first changing his dress for a coloured cotton shirt and trousers and bare feet, and then take a siesta with a book. About four, after a cup of tea, he would walk round his premises, and generally stroll down to Mamajam, to pay me a visit and look after his farm.

This consisted of a colfee plantation and an orchard of fruit trees, a dozen horses and a score of cattle, with a small village of Timorese slaves and Macassar servants. One family looked after the cattle and supplied the house with milk, bringing me also a large glassful every morning, one of my greatest luxuries. Others had charge of the horses, which were brought in every afternoon and fed with cut grass. Others had to cut grass for their master's horses at Macassar-not a very easy task in the dry season, when all the country looks like baked mud; or in the rainy season, when miles in every lirection are flooded. Llow they manared it was a mystery to me, lout they know grass must be had, and they get it. One lame woman had charge of a flock of ducks. Twice a day she took them out to feed in the marshy places, let them waddle and gobble for an hour or two, and then drove them back and shut them up in a small dark shed to digest their meal, whence they gave forth occasionally a melancholy quack. Every night a watch was set, principally for the sake of the horses, the people of Goa, only two miles off, being notorious thieves, and horses offering the easiest and most valuable spoil. This enabled me to sleep in security, although many people in Macassar thought I was runing a great risk, living alone in such a solitary place and with such bad neighbours.

My house was surrounded by a kind of straggling hedge of roses, jessamines, and other flowers, and every moming one of the women gathered a baskelful of the blossoms for Mr. Mesman's family. I generally took a couple for my own breakfast table, and the supply never failed during my stay, and I suppose never does. Almost every Sumday Mr. M. made a shooting excursion with his ehtest son, a lad of fitteen, and I generally accompanied him; for though the Dutch are Protestants, they do not observe Sunday in the rigid manner practised in England and English colonies. The Govemor of the place has his public reception every Sunday evening, when card-playing is the regular amusement.

On December 13th I went on beard a pran bound for the Arn Islands, a journey which will be deseribed in the latter part of this work.

On my return, after a seven months' absence, I visited another district to the north of Macassar, which will form the subject of the next chapter.

## CHAPTER XVI.

## celebes.

(Macassar. JULy to novembelt, 1857.)

IREACLED Macassar again on the 11th of July, and established myself in my old quarters at Mamajam, to sort, arrange, clean, and pack up my Aru collections. This recupied me a month; and having slipped them off for Singapore, had my guns repaired, and received a new one from England, together with a stock of pius, arsenic, and other collecting requisites, I bergan to feel cager for work again, and hat to consider where I should spend my time till the end of the year. I had left Macassar, seven months before, a flooded marsh being ploughed up for the rice-sowing. The rains lad continued for five months, yet now all the rice was cut, and dry and dusty stubbles covered the country just as when I had first arrived there.

After muck inquiry I determined to visit the district of Maros, about thirty miles north of Macassar, where Mr. Jacob Mesman, a brother of my friend, resided, who had kindy offered to find me house-room and give me assistance should I feel inclined to visit him. I accordingly obtained a prass from the hesident, and having hired a boat set off one evening for Máros. My boy Ali was so ill with fever that I was obliged to leave him in the hospital, under the care of my friend the German doctor, and I had to make shift with two new servants utterly ignorant of everything. We consted along during the might, and at daybreak entered the Máros river, and by three in the alternoon peached the village. I immediately visited the Assistant Resident, and applied for ten men to
carry my baggage, and a horse for myself. These were promised to be ready that night, so that I could start as soon as I liked in the morning. After having taken a cup of tea I took my leave, and slept in the boat. Some of the men came at night as promised, but others did not arrive till the next moming. It took some time to divide my baggage fairly among them, as they all wanted to shirk the heavy boxes, and would seize hold of some light article and marela off with it, till made to come lack and wait till the whole had been failly apportioned. At lengtls about eirght o'clock all was arranged, and we started for our walk to Mr. M's farm.

The country was at first a uniform plain of burnt-up sice-grounds, hut at a few miles' distance preeipituus hills arpeared, backed by the lofty central range of the peninsula. Towards these our path lay, and after having gone six or eight miles the hills began to advance int. the plain right and left of us, and the ground becanpierced here and there with bloeks and $p^{\text {illars }}$ of limestone rock, while a few alrupt conical hills and peaks rose like islands. I'assing over an elevated tract forming the shoulder of one of the hills, a picturesque scene lay before us. We looked down into a little valley almost entirdy surrounded by mountaius, risiug abruptly in huge precipices, and forming a succession of knolls and peaks and domes of the most varied and fantastic shapes. In the very centre of the valley was a large bamboo house, while scattered around were a dozen cottages of the same material.

I was kindly received by Mr. Jacoh Mesman in an airy saloon detached from the house, and entirely built of hamboo and thatehed with grass. After breakfast he took me to his foreman's houst, about a hundreel yards off, half of which was given up to me till 1 should decide where to have a cotage built for my own use. I soon found that this spot was too much exposed to the wind and dust, which rendered it very diflicult to work with papers or jusects. It was also dreadfully hot in the atternoon, and after a few days I got a sharp attack of fever, which determined me to move. I accordingly fixed on a place about a mile off, at the foot of a forest-covered hill,
where in a few days Mr. M. built for me a nice little honse, consisting of a good-sized enelosed verandah ol ofen room, and a small inner sleeping-room, with a little cooklionse outside. As soon as it was finished I movor into at, aml found the change most agreeablo.

The forest which surrounded me was open and fiee from underwood, consisting of large trees, widely scattered with a great quantity of phim-trees (Arenga saccharifera), from which pahn wine aml surar are made, 'There were also great nombers of a wild , Tack-firuit tree (Arlocarpus),
which bore abundance of large reticulated fruit, serving as an excellent vegetable. The ground was as thickly covered with dry leaves as it is in an English wood in November; the little rocky streans were all dry, and scarcely a drop of water or even a damp place was anywhere to be seen. About filty gards below my house, at the foot of the hill, was a deep labe in a watercourse where good water was to be lad, and where I went daily to bathe, by having buckets of water taken out and pouring it over my body.

My host Mr. M. ajoyed at thoroughly country life, depending ahoost entively on his gim and dogs to supply his table. Wild pirs of large size were very plentiful ant he gencrally got one or two a week, besides teer occasionaly, and abumdance of jungle-fowl, hornbills, and great fruit pigeons. His bullahers supplied phenty of milk, from which he made his own butter; he grew his own pice and collee, athd hat ducks, fowls, and their egrs in protusion. Dis patm-tress supphied him all the year round with "sagueir," which takes the phace of beer; and the sugar made from then is an excellent sweetneat. All the fine tropical vegetables and fruits were abondant in their season, and his cigars were made from tobaceo of his own raising. He kindly sent ane a bamboo of butiabomilk every moming; it was as thich as cream, and reyuired diluting with water to keep it fluid duriug tine biay: It mixes very well with tea and collee, although it hats It slight peouliar havour, which alter a than is not disagreeable. I also got as much sweet "sagucir "as l liked to drink, and Mr. M. always sent me a piece of each pig he killed, whel with fowls, eggs, and the birds we shot onrselves, ant buffalo beef about once a fortnight, kept uy larder sufficiently well supplied.

Every bit of that land was efeared and used as ricefields, ant on the lower slopes of many of the hills tobacen and vegetables were grown. Most of the slopes are covered with luge blocks of rock, very fatiguing to seramble over, while a manber of the hills are so pre--ipitous as to be quite inaccessible. These circumstances, combined with the excessive drought, were very unlanomable for my pursuits. Jinds wera scarce, and I got but
fiew new to me. Insects were tolerably plentifin, but unequal. Beetles, usually so mumerous and interesting, were exceedingly scaree, some of the tamilies being quite absent and others only represented by very minute species. The Flies and Bees, on the other hand, were abundant, and of these 1 daily obtained new and interesting species. The rare and beautiful Butterflies of Celebes were the chief object of my search, and 1 found many species altogether new to me, but they were generally so active and shy as to render their capture a matter of great difticulty. Almost the oniy good place for them was in the dry beds of the streams in the furest, where, at damp phaces, muddy pools, or even on the dry rocks, all sorts of insects could be found. In these rocky forests dwell some of the finest butterflies in the word. Three species of Unnithoptera, measuring seven or eight inches across the wings, and beautifully marked with spots or masses of satiny yellow on a black ground, wheel through the thickets with a strong sailing tlight. About the damp phates are swarms of the beautitul blue-banded lapilios, miletus and telephus, the superb golden green P' macedon, fud the rare little swallow-tail l'apilio rhesus, of all of which, though very active, I succeeded in capturing tine series of specimens.

I have rarely enjoyed myself more than during my residence here. As 1 sat taking my collee at six in the morning, rate birds would often bo seen on some tree close by, when I would hastily sally out in my slippers, and perhaps secure a prize I had been seeking atter for weeks. The great hombills of Celebes (Buceros cassidix) would olten come with loud-flapping wings, and perch upon a loty tree just in trout of sue ; and the black buthon monkeys, Cympithecus nigrescens, often stared down in astonishment at such an intrusion into their domains; while at night herels of wild pigs roaned about the house, devonring refuse, and obliging us to put away everything eatabee or breakable from one little cooking-huuse. A few minutes' search on the fallen trees around my house at sumise and sunset, would often produce me more beetles than I would meet with in a day's collecting, and odd monents could be made valuable which when living in
villages or at a distance from the forest are inevitably wasted. Where the sugar-palms were dripping with sat. Hies congremated in immense numbers, and it was by spending lati an bour at these when I had the time to spare, that I ultatimed the finest and most remarkable collection of this gromp of insects that I have ever made.

Then what delighthut hous I passed wandering up and down the dry river-courses, full of water-holes and rocks and fallen trees, and overshadowal by manificent vegetntion! I soon got to know every hole and rock and stump, and came up to each with cautons step and bated breath to see what treasures it would produce. At onts Hace I would find a little crowd of the rare butterty 'Tuchyris zarinda, which wonld rise up at my apprath. and display their vivil orange and cimabar-ved wings, while anong them would flutter a few of the dine blushanded I'tpilios. Where leafy braches lung over the mully, I might expect to find a grome Omilhoptera at rest and an easy prey. At cortain rotton trunks I was sure tu get the curions litte tiger beethe, Therates davilabris. In the denser thickets I would capture the small metallic blue butterties (Amblyoolia) sitting on the leavers, as well as some rate and beautifal leat-bectles of the families Hispide and Chrysomelides.

I found that the rotten jack-fruits were rery attractive to many beetles, atul used to split them partly open and lay then about in the forest near my louse to rot. A moming's searel at these often produced me a sore of species, -Staphylinide, Nitidulide, Onthophagi, aul minute Catahide being the most abundant. Now and then the "sagueir" " makers brourht me a fine rosechafer (Stemoplus schaumii) which they found licking up the sweet sap. Ahost the finly new hirds I met with for some time were a handsone grombd thrush (IPita celebensis), and a beautiful riolet-crowned dace (l'ilonopus celebusis), both very similar to birds I had recently obtained at Aru, but of distinct species.

About the latter part of September a heary shower of rain fell, admonishing us that we might soon expect wet weather, much to the advantage of the haked-up conntry: I therefore determined to may a visit to the falls of the

Maros river, situated at the point where it issues from the mountains-a spot often visited by thaveliers and considered very beautiful. Mr. M. lent me a horse, and I obtained a guide from a neighbouring village; and taking one of my men with me, we started at six in the morning, and after a ride of two hours over the flat rice-fields skirting the momntains which rose in grand precipices on our left, we reached the river about half-way between Maros and the falls, and thence had a ghod brille-road to our destination, which we reached in another hour. The hills had clased in rounl us as we advanced; and when we reached a ruinous slem which had been erected for the accommodation of visitors, we found ourselves in a flatbottomed valley about a ${ }^{\text {puatrer of }}$ of mile wide, bounded by precipitous and ofter owerhating limestone rocks. So fir the ground had ben cultivated, but it bow becane covered with bushes and large scattered trees.

As sum as my seanty bagquae had arrived and was duly deposited in the shed, 1 statted off alone for the fiall, which was about a guarter of a mile further on. The river is here abont twenty yards wide, and issues from a clasm between two vertien walls of limestone, over a romuled mass of hasaltic rock abont forty fect high, forming two curves separated by a slight leque. The water spreads leantifnlly over this surface in a thin sheet of foam, whel curls and eddies in a suceession of concentric cones till it falls into a fine deep prol below, Close to the vely edre of the fall a mars and very rugged path leats to the river above, and thence continues clase muder the precipice along the water's edge, or sometimus in the water, for a fow hombed parts, after which the rocks reede a lithle, and leave a womed bank on one side, along whinh the path is continted, till in about lalf a mile a second and smaller fall is reached. Itere the river seens to issue from a cavern, the rocks having fallen from above so as to block up the chamed and hat further progress. The fall itself can only be reached by a path which ascents behind a hare slice of rock which lits partly fallen away from the mountain, leaving a space two or three feet wide, but disclosing a dark chasm descending into the lowels of the mountain, and which,
having visited several such, I had no great curiosity to explore.

Crossing the stream a little beluw the upper fall, the path ascends a steep slope for about five hondred feet, and passing through a gap enters a narrow volley, shut in by walls of rock absolutely perpeudicular and of great height. Half a mile further this valley tums abruptly to the right, and becomes a mere rift in the mountain. This extends another half mile, the walls gradually approaching till they are only two feet apart, and the bottom rising steeply to a pass which leads probably into another valley. lut which I had no time to explore. Jetuming to where this rift had begun, the main path turns up to the left in a sort of gully, and reaches a summit over which a tine natural areh of rock passes at at height of about fifty feet. Thence was a steep descent through thick jungle with ghmpes of precipices and distant roeky mountains, probably leading into the main river valley again. This was a most tempting region to explore, but there were several reasons why I coukl go no further. I hat no guide, and no permission to enter the Imgis tervitories, and as the rails minht at any time set in, I might be prevented from returning by the llooding of the river. 1 therefore devoted myself during the shom tine of my visit to obtaining what kowledge I cond of the natural productions of the place.

The narmow chasus protuced several fine inseets quite new to me, and one new lint, the eurions Phlagents tristigmata, a large ground pigcon with yellow breast and crown, and puple neek. This ruged path is the highway from Maros to the Bugis country leyond the monatains. During the rainy seasun it is quite impassable, the river filling its leal and rushing between perpendicular clifs: many hundred feet high. Jven at the time of my visit it was most precipiturs inul fatigning yet women an! children came over it daily, and men carryiug heavy loads of palm sugar of very little value. It was along the path between the lower and the mper fialls, and abont the mangin of the upper pool, that I fonsed most inseets. The large semi-transparent butterty, ldea tomdana, thw lazily atong by dozens, and it was here that I at length
oltained an insect which I had hoped but hardly expected to meet with-the magnificent Papilio androcks, one of the largest and rarest known swallow-tailed butterfies. During my four days'stay at the falls I was so fortunate as to obtain six rood specimens. As this beautiful creature flies, the long white tails ilicker like streamers, and when settled on the beadl it carties them raised upwards, as if to preserve them from injury. It is searce even here, as I did not see more than a dozen specimens in all, and had to follow many of them up, and down the river's bank repeatedly before I succeeded in their capture. When the sun shone hatiest aloont noon, the moist beach of the pool below the upper fall presented a beautiful sight, being dotted with groups of gay butter-Hies,-orange, yellow, white, blue, and green,-which on leing disturbed rose into the air by limndreds, forming clouds of variegated colours.

Such gorges, chasms, and precipices as here abound, I have nowhere seen in the Archipelago. A sloping surtace is scarcely anywhere to le found, hage walls and roged masses of rock terminating all the mountains and inclosing the valleys. In many parts there are vertical or even overlanging precipices five or six hundred feet high, yet completely clothed with a tapestry of vegetation. Ferns, Pandanacee, shous, creepers, and even forest trees, are mingled in an evergrect network, through the interstices of which appears the white limestone rock or the dark holes and chasms with which it abounds. These precipices are evabled to sustain such an anount of vegetation by their peculiar structure. Their surfaces are very irregular, broken into holes and fissures, with ledges overhauging the mouths of ghomy caveras; but from each projecting part have descended stalactites, cften forming a wild gothic tracery over the caves and receding hollows, and alfording an admirable support to the ruots of the shrubs, trees, and creepers, which luxuriate in the warm ${ }^{\text {bure athosphere }}$ and the gentle moisture which constantly exudes from the rocks. In phaces where the precipice offers smooth surfaces of solid roek, it remains yuite bare, or only stained with lichens and doted with chmps of ferns that grow on the small ledges and in the minutest crevices.

The render who is familiar with tropical nature only through the medium of books and botanieal gardens, will picture to himself in such a spot many other natural beauties. He will think that I have maccountably forgrotten to mention the brilliant llowers, which, in rorgeous masses of crimson gold or azure, must spangle these verdant precipices, hang over the cascade, and adom the margin of the mountain stream. But what is the reality? In vain did I gaze over these vast walls of verdure, among the pendant crecpers and bushy shrubs, all around the cascade, on the river's bank, or in the deep caverns and gloomy tissures,-not one single spot of bright colour could be seen, not one single tree or bush or creeper hore a ilower sufliciently conspionous to form an object in the landsape. In every direction the eye rested on nreen folinge and mottled rock. There was infinite variety in the colour and aspect of the foliage, there was grandeur in the rocky masses and in the exaberant luxuriance of the vegetation, but there was no brilliancy of colour, none of those bright thwers and gorgeous masses of blosson, so generally considered to be everywhere present in the tropics. I have here given an aceurate sketeh of a luxuriant fropical scene as noted down on the spot, and its deneral characteristics as regards colour have been so often repeated, both in South America and over many thousuad miles in the Eastern tropies, that 1 am driven to conclude that it represents the general aspect of nature in the equatorial (that is, the most tropical) parts of the tropical reaions. How is it then, that the descriptions of travellers generally give a very different idea? and where, it may be asked, are the glorious flowers that we know do exist in the tropics? These questions can be easily answered. The fine tropical thowering-plants cultiwated in our hothouses, have been culled from the most varied regions, and therefore give a most erronems dea of their abundance in any one region. Many of them are very mare, others extremely local while a considerable number inhabit the more arid regions of Africa and India, in which tropical vegetation does not exhibit itself in its usual luxuriance. Fine and varied folinge, rather than gay Howers, is nore characteristic of those parts where tropical
veretation attains its highest development, and in such districts each kind of thower seldom lasts in perfections more thm a fow weeks, or sometimes a few days. In ayery loatity a Lengthened residence will show an abordane of magniticont and gaily-blossoned plants, but they have to be sought for, and are ravely at any one time "n phace so abumbat as to form a perceptible feature in the hambeape. Gint it has been the custom of travellers in describe and group together all the fine plants thay have met with chumg a lorg jonmey, and thus prodnce the effect of a gay and thower-painted lamescape. They have rately stadied and deserihed individual seenes where vegetation was must luxuriant and beautiful, and fairly stated what effect was protheed in them by thowers. I have done so frequently, and the result of these examinations has convinced me, that the bright colours of llowers have a much speater inlueuce on the general aspect of nature in tennerate than in tropical climates. During twelve years spent amid the grandest tropical veretation, I have seen nothing comprabe to the effect produced on our landscapes ly gorse, broom, heather, widd hyneinthe, hawthorn, purple orchises, and buttercups.

The geolonital structure of this part of Celebes is interesting. The limestone momitains, though of great extent, seem to be entively superficial, resting on a basis of basalt which in some phaces forms low rounded hills between the more precipitous nountains. In the rocky beds of the strems hasalt is almost always fonnd, and it is a step in this ruck which firms the cascade already described. From the limestune precipices rise abruptly; and in ascending the little stainway along the site of the fall, you step two or three times from the one rock on to the other, -the limestone dry and rough, being wom by the water and rains into sharp ritges and honeycombed holes,- the basalt moist, even, and worn smooth and slippery by the passage of bare-footed pedestrians. The solubility of the limestone by min-water is well seen in the little blocks and peaks which rise thickly through the soil of the alluvial plains as you approach the mountains. They are all skittle-shaperl, lamer in the middle than at the base, the greatest diancter velurring at the height to which the
country is flooded in the wet season, and thence decreasing regularly to the ground. Many of them overhang considerably, and some of the slemterer pillars appear to stame unon a point. When tho rock is less solid it becomes curiously honeycombed by the rains of successive winters, and I noticed some masses reduced to a complete network of stone, through which light could be seen in every direction. From these mountains to the sea extends a perfectly flat alluvial plain, with no indication that water would atelamulate at a treat depth beneath it, yet the authorities at Macassar have spent much money in boring a well a thousand feet deep in hope of getting a supply of water like that obtained by the Artesian wells in the London and Iaris basins. It is not to be wondered at that the attempt was unsuccessful.

Heturning to my forest hut, I continued my daily search after binds and insects. The weather however became dreadfully hot and dry, every drop of water disappearing from the pools and rock-holes, and with it the insects which frequenter them. Only one gronp remained unaflected by the intense drought; the Diptera, or two-winged Hies, continued as plentiful as ever, and on these I was almost compelled to concentrate my attention for a weck or two, by which means I increased my collection of that Order to about two hundred species. I also continuel to ohtain a few new hirds, among which were two or three kinds of small hawks aud falcons, a beantiful brushtongued paroquet, Trichoglossus ornatus, and a rave bhack and white crow, Corvus alvena.

At length about the midile of October, after several gloomy days, down came a deluge of rain, which continned to fall ahost every aftemoon, slowing that the early part of the wet season hat commenced. I hoped now to get a good harvest of insects, and in some respects I was not lisappointed. liertles became much more numerous, and under a thick bed of leaves that had acemmulated on some rocks by the side of a forest atrem, I found abundance of Carabide, a family generally scarce in the tropics. The butterflies however disappeared. Two of my servants were attacked with fever, dysentery, and swelled feet, just at the time that the third had left me, and for some days
they both lay groaning in the house. When they grot is little better I was attacked myself, and as my stores were nearly finished and everything was getting very danp, I was obliged to prepare for my return to Macassar, especially as the strong westerly winds would render the passage in a small open boat disagrecable if not dangerous.

Since the rairs began, numbers of huge millipedes, as thick as one's finger and eight or ten inches long, crawled about everywhere, in the paths, on trees, abont the house, -and one morning when I got up I even found one in my bed! They were generally of a dull lead colour or of a deep brick red, and were very masty-looking things to beo coming everywhere in ones way, alhough quite hambess. Snakes too bergan to show themselves. I killed two of it very abmadat species, big-headed and of a brisht green colour, which lie coiled up on leaves and shrubs and tan searcely be seen till one is close upon them. Brown snakes got into my net while leating among dead leaves for insects, and made me rather cautions about inserting my hand till I knew what kind of game I had captured. The fielts and meadows which hat been parched ant sterile, now became suldenly coverch with tine long grass : the river-bed where I hat so many times walked over burning rocks, was now a deep and rapid stream; and numbers of herbaceous plants and shruls were everywhere springing up and bursting into flower. I found plenty of new insects, and if I had hal a good, roomy, water-and-wind-proof house, I shonld perhaps have stayed during thewet season, as I feel sure many things can then be obtained which are to be found at no other time. With my summer hut, however, this was impossible. During the heavy rains a fine drizzly mist penetrated into every part of it, and I hegan to have the greatest difficulty in keeping my specimens dry.

Early in November I returned to Macassar, and having packed up my collections, started in the Dutch mail steamer for Amboyna and Ternate. Leaving this part of my journey for the present, I will in the next chapter conchude my account of Celebes, by describing the extreme northem part of the island which I visited two years later.

## CHAPTER XVII.

## celenes.

(MENADO, JUNE TO SEPTEMBER, 1859.)

ITT was after my residence at Timor-Coupang that I visited the north-eastern extremity of Celebes, touching on my way at Banda, Amboyna, and Temate. I reached Menado on the $16 t h$ of June, 1859, aud was very kindly reseived by Mr. 'lower, an Enghishman, but a very old resident in Menado, where he carries on a general business. He introdnced me to Mr. L. Daivenboden (whose fatiser had been my friend at 'lermate), who had much taste for natural history; and to Mr. Negs, a mative of Menado, but who was educated at Calentia, and to whom Dutch, English, and Mahay were equally mother-tongues. All these gentlemen showed the the greatest kinduess, aceonpanied me in my entiest walks ahout the country, and assisted me by every menns in their power. I spent a week in the town very pleasantly, making explorations and inquiries after a good collecting station, which I had much difficulty in timing, onsing to the wide cultivation of coffee and eaca, which hats led to the clearing away of the forests for many miles round the town, and over extensive districts far iuto the interior.

The little town of Menado is one of the prettiest in the East. It has the appearance of a large garden containing rows of rustic villas, with broud paths between, forming streets generally at ight augles with euch other. siout roads batach off in several directions towards the interior, with a succession of pretty cottages, neat gadens, and thriving plantations, interspersed with widernesses of fruit trees. To the west and south the country is mountainous, with groups of fine volcanic pataks 6,000 or 7,000 teet high, forming grand and picturesgue backgrounds to the landscape.

The inhabitants of Mimhasa (as this part of Celebes is called) differ much from those of all the rest of the island,
and in fact from any other people in the Archipelago. They are of a light-brown or yellow tint, often approachfing the faimess of a Europeau; of a rather slort stature, stout and well-mate; of an open and pleasing countenance, more or less distigured as age increases by projecting cheek-bones; and with the usual long, straight, jet-black hair of the Malaym races. In sone of the inland villages where they may be supposed to the of the purest race, both men and women are renarkably handsome; while nearer the consts where the purity of their blood has heen destroyed by the intemmixture of other races, they approaeh to the ordinary types of the wild inhabitants of the surrounding countries.

In mental and moral characteristics they are also highly peculiar. They are remarkably quiet and geutle in disposition, sulmissive to the authority of those they consider their superiors, and easily imbuced to learn and adopt the habits of civilized people. They are clever mechanics, and seem capable of acquiring a cousiderable amount of intellectual education.
$U_{p}$ to a very recent period these people were thorough savares, and there are persons now living in Menado who remember a state of things identical with that described by the writers of the sixteenth and seventeenth centuries. The inhabitants of the several villages were distinct tribes, tach under its own chiel, speaking languages uaintelligible to each other, and almost always at war. They built their houses elevated upon lofty posts to defend themselves from the attacks of their enemies. They were head huaters like the Dyaks of Borneo, and were said to be sometimes camnibals. When a chief died, his tomb was adorned with two fresh human heads; and if those of onemies could not be obtained, slaves were killed for the occasion. Human skulls were the great ormaments of the chiefs' houses. Strips of bark were their only dress. The country was a pathless wilderness, with small cultivated patches of rice and vegetables, or clumps of fruit-trees, diversilying the otherwise unbroken forest. Their rehigion was that nuturally engendered in the undeveloped human mind by the contemplation of grand natural phenomena and the luxuriance of tropical nature. The buraing
mountain, the torrent and the lake, were the abode of their deities; and certain trees and birls were supposed to have especial influence over men's actions and destiny. They held wild and exciting festivals to propitiate these deities or demons; and believed that men could be changed by them into animals, either during life or after death.

Here we have a picture of tue savage life; of small isolated commonities at war with all around them, subject to the wants and miseries of such a condition, drawing a precarious existence from the luxuriant soil, and living on from generation to generation, with no desire for jhysieal anclioration, and no prospert of moral adsancement.

Such was their condition down to the year 1822 , when the coffee-plant was first introlneed, ind experiments were made as to its cultivation. It was found to succeed admirably at from fifteen hundred up to four thousand feet above the sea. The chiefs of rillages were induced to undertahe its cultivation. Seed and native instructors were sent from. Jiva; food was supplied to the labourers engaged in clearing and planting ; a lixed price was established at which all coffee brought to the govermment collectors was to be paid for, aud the villare chiefs who now received the titles of "Majors" were to reedve live per cent. of the produce. After a time, roads were made from the port of Menado up to the plateau, and smaller paths were cleared from village to village; missionaries settled in the more populous districts and opened schools, and Chinese traders penetrated to the interior and supplied clothing and other luxuries in exchange for the money which the sate of the coffee had produced. At the same time, the country was divided into districts, and the system of "Controlleurs," which had worked so well in Java, was introduced. The "Controlleur" was a European, or a native of European blood, who was the general superintendent of the cultivation of the district, the adviser of the chiefs, the protector of the people, and the means of communication between both and the Ewopean Government. His duties obliged him to visit every village in succession once a month, and to send in a report on their condition to the Resident. As disputes botwen adjacent villages were now settled by appeal to a superior authority, the old and inconvenient
semi-fortified houses were disused, and under the direction of the "Controlleurs" most of the houses were reluilt on a neat and uniform plan. It was this interesting district which I was now about to visit.

Having decided on my route, I started at 8 A.m. on the $22 d$ of June. Mr. Tower drove me the first three miles in his chaise, and Mr. Neys accompanied me on horseback three miles further to the village of Lotta. Here we met the Controllen of the district of Tondano, who was returning home from one of his monthly tours, and who had fyrceal to act as my cruide and companion on the journey. From Lonta we had an almost continal aseent for six miles, which brought us on to the plateau of Tondáno at an clevation of about 2,400 feet. We passed through three villares whose neatness and beaty quite astonished me The main roml, atoner which all the confe is bronght down from the interior in carts drawn by buffalnes, is always turnel aside at the entrance of a village, so ns to pass behind it, amb thus allow the villoge street itself to be kept neat and clean. This is bordered by neat hedges often formed entively of rose-trees, which are perpetually in Whason. There is a broad central path and a burder of fine turf, which is kept well swept and neatly eut. The houses are all of wool, raised about six feet on smbstantind posts neatly painted bue, while the walls are whitewashed. They all have a verautalh enclosed with a neat balustmade, and are generally surromated ly orange-trees and tlowering shrubs. The surrounding scenery is verdant and picturesque. Colfe plantations of extreme luxuriance, nolle pahmand tree ferns, wooted hills and voleanic peaks, everywhere meet the eye. I had hard much of the beaty of this country, hat the reatity fir surpassed my expectations.

Atout one o'clock we reached 'romohon, the chicf place of a district, having a native chicf now called the "Major," at whose home we were to dine. Here was it fresh surprise for me. The house was large, airy ant very subsantially built of larel native timber, squared and put together in a most wortmanlike manner. It was furnished in Luropean style, with hamdsome chandelier lamps, and the chairs and tables all well made by native workmen. As soon as we entered, madeira and bitters were offered us. Then two
handsome boys neatly dressed in white and with smoothly brushed jet-black hair, hauded us each a basin of water and a clean napkin on a salver. The dimer was excellent. Fowls cooked in various ways, wihl pig roasted stewed and fried, a fricassee of bats, potatoes rice and other vegetibles, all served on good china, with dinger glasses and fine napkins, and abundance of good clatet and heer, seemed to me rather curious at the tathe of a mative chief on the mountains of Celebes. Our host was dressed in a suit of black with patent-leather shoes, and really booked comfortable and almost gentlemanly in them. Ii? sat at the head of the table and did the homours well, though lie did not talk much. Our conversation was eutirely in Malay, as that is the oflicial language bere, and in lact the mother-tongue and only language of the controlleur, who is a mative-bom half-breed. The Major's lather, Who was chief before him, wore, I was informed, a strip of bark as his sole costume, aud lived in a rude hut raised on Lofty poles, and abundantly decorated with human heads. Of course we were expected, and our dinner was prepared in the best style, hut I was assured that the chief's all take a pride in ndopting European customs, and in being able to receive their visitors in a handsome manner.

After dimer and coflee, the Controlleur went on to 'Tundino, aud I strolled about the sillage waiting for my baggage, which was coming in a bullock-cart and did not arrive till after midnight. Supper was very similar to dinner, and on retiring I found an elegant little room with a comfortable bed, ganze curtains with blue and red hagings, and every convenience. Next morning at sunrise the thermometer in the veramah stom at $69^{\circ}$, which l was toh is about the usual lowest temperature at this place, 2,500 feet above the sea. I hat a good breakfast of coliee, egrgs, and fresh bread aud butter, which I took in the spacious verandah, amid the odour of roses, jessanine, and other sweet-secuted flowers, which filled the garden in front; ant alout eight o'cluck left Tomohón with a dozen men carrying my baggage.

Our road lay over a mountain ridge about 4,000 feet above the sea, and then descended aboul 500 feet to the little village of Rurúlau, the highest in the district of

Minahasa, and probably in all Celebes. Here I had determined to stay for some time to see whether this eleva. tion would produce any change in the zoology. The village had only been formed about ten years, and was quite as neat as those I had passed through and mueh more picturesque. It is placed on a small level spot, from which there is an abrupt wooded descent down to the beautiful lake of Tondino, with volcanic mountains beyond. On one side is a ravine, and beyond it a fine mountainous and wooded country.

Near the village are the coffee plantations. The trees are planted in rows, and are kept topped to about seven feet high. This causes the lateral manches to grow very strong, so that some of the trees become perfect hemispheres, loaded with fruit from top to boitom, and producing from ten to twenty pounds each of cleaned coffee annually. These plantations were all formed by the Government, and are cultivated by the villagers ander the direction of their chief. Certain days are appointed for weeding or gathering, and the whole working population are summoned by sound of hgong. An account is kept of the number of hours' work done by each family, and at the year's end the produce of the sale is divided among them proportionately. The coffee is taken to Goverument stores established at central places over the whole country, and is paid for at a low fixed price. Out of this a certain percentage goes to the chicfs and majors, and the remainder is divided among the inhabitants. This system works very well, and I believe is at present far better for the people than free-trade would be. There are also large rice-fields, and in this little village of seventy houses I was informed that a hundred pounds' worth of rice was sold annually.

I had a small house at the very end of the village, almost hanging over the precipitous slope down to the stream, and with a splendid view from the verandiah. The thermometer in the morning often stood at $62^{\circ}$ and never rose so high as $80^{\circ}$, so that with the thin clothing used in the tropical plains we were always cool and sometimes positively cold, while the spout of water where I went daily for my bath had quite an icy feel. Although I
enjoyed myself very much among these fine mountains and forests, I was somewhat disappointed as to my collections. There was havdly any parceptible dithorence between the animal lile in this iemperate region and in the torrid plains below, and what diference did exist was in most respects disadvantageons to me. Thore secmed to be nothing absolutely peculsar to this elevation. Sirds and quadrupeds were less phantiful, bat of the same species. In insects there seemed to be more diference. The curious beetles of the family Cleridie, which are found chiefly on batk and watera word, were finer than I lave seen them elsewhere. The bratifal Longicoms were scarcer Han usual, and the lew butterflies were all of tropical species. One of thesp, lapilio hlumei, of which 1 obtained a few specimens only, is anomg the most magnificent I have ever seen. It is a green aud gold swallow-tail, with azure-blue spoon-shaped tails, and was otten seen Hying ahout the village when the sum shone, but in a very shatered condition. The yreat amonnt of wet and clourly weather, was a great drawhack all the time I was at Rurúkan.

Len in the vegetation there is very little to indicate elevation. The trees are more covered with lichens and moses, and the ferns and tree-fems are finer and more luxuriant than I had been accustomed to see them on the low grounds, both probably attributable to the almost perpetual moisture that here prevails. Abundance of a tasteless rasphery, with blne and yellow Composite, hawe shmewhat of a temperate aspect; and minute ferns and Orehidene, with dwarf Becronias on the rocks, make somos approach to a sub-alpine vegetation, The forest however is most luxuriant. Noble palms, Pandani, and tree-ferns are almudant in it, while the forest trees are completely festoned with Otchidea, Brommlie, Aracee, Lycopodinms, and mosses. The ordinary stemless firns abound; some with gigantic fronds ten or twelve feet long, others harely an inch high; some with entire and massive leaves, others elegantly waving thoin finely-cut foliage, and adding endless variety and intersit to the forest paths. The mooa-mat palm still produces fruit abundantly, but is said to be deficient in oil. Oranges thrive better than
below, producing abundance of delicions fruit; but the shaddock or pumplemous (Citrus decumana) requires the full force of a tropical sun, for it will not thrive even at Tondano a thousand feet lower. On the hilly slopes rice is cultivated largely, and ripens well, although the temperature rarely or never rises to $80^{\circ}$, so that one would think it might be grown even in England in fine summers, especially if the young plants were raised under glass.

The mountains have an unusual quantity of earth or vegetable mould spread over them. Even on the steepest slopes there is everywhere a covering of clays and sands, and genemally a good thickness of vegetable soil. It is this which perhaps contributes to the uniform luxuriance of the forest, and delays the appearanee of that sub-alpine vegetation which depends almost as much on the abundance of rocky and exposed surfaces as on difference of elimate. At a much lower elevation on Mount Ophir in Malacea, Dacrydiums and Rhododendrons with abundance of Nepenthes, ferns, and terrestrial orehids suddenly took the place of the lofty forest; but this was plainly due to the occurrence of an extensive slope of bare granitic rock at an elevation of less than 3,000 feet. The quantity of vegetable soil, and also of loose sands and clays, resting on steep slopes, hill-tops and the sides of ravines, is a currous and important phenomenon. It may be due in part to constant slight earthquake shocks, facilitating the disiutegration of rock; but would also seem to indieate that the country has been long exposed to gentle atmospheric action, and that its elevation has been exceedingly slow and contimuous.

During my stay at Rurúkan my curiosity was satisfied by experienciug a pretty sharp carlhquake-shock. On the evening of June 29th, at a quarter after eight, as I was sitting reading, the house began shaking with a very gentle, but rapidly increasing motion. I sat still enjoying the novel sensation for some seconds; but in less than half : minute it heeame strong enough to shake me in my chair, and to make the house visibly rock about, and creak an crack as if it would fall to pieces. Then began a crv throughout the village of "Tana goyang! tana goyang!"
（Earthquake！earthquake！）Everyboly rushed out of their houses－women screaned and childven cried－and i thought it prodent to go out too．On getting up，I found my head gidely and my steps unsteady，and could hardly walk without filling．The sloock contmued abont a minute， daming which time I felt as if 1 hat heen tumad rommd and round，and was almost sea－sick，Going into the lomse again．I foumd a lamp and is bottle of anate upset．Thee tumbler which formed the lamp had heen thrown out di the sancer in which it lad stoud．The shock appeared to be nearly vertical，rapid，vibratory，and jeming．It was sulficient，I have no doubt，to have throws down brisk chimneys and walls and chureh towers；but as the houses leve are all low，and strougly framed ot timber，it is impons－ sible for them to be muel injured，except by a shock that would utterly destroy a European city．The pengle tohd rue it was ten years since they had lind a stronser show that this，at which time many houses were Llorown down aml some people killed．

At intervals of ten minutes to balf an hour，slight shocks and tremors were felt，sometimats strong enotgit th send us all out again．There was a strange mixture of the temible ant the hulicrous in our situation．We might at any moment have a much stronger shock，which would lining down the lwase over us，or－what 1 feamed more－ ranse a landship，and send us down into the deep ravine on the wery edge of which the sillage is built；yet ： couk not help langhing cach time we nan out at a slinht shock，and then in a few moments ban in agin．The sublime and the ridiculous were here literally but a ster 1 apart．On the one hand，the most terrible amd destructive of natural phemomena was in aelion aronnd m－the rocks， the mountains，the solid earth were trenbling and con－ vulsed，and we wre uttenly impotent to grame against tho ulanger that might at any moment uwerwhelan us．On the other hand was the spectacle of a munber of nen，women， and ehidren running in and out of their louses，on what each time proved a very unneossary ulam，as each shock ceased just as it hecame strong conough to frighten us．It seemed really very much like＂playing at earthquakes，＂ and made many of the people join me in a hearty laugh，
even while reminding each other that it really might be no laughing matter.
At- length the evening got very cold, and I became very sleepy, and determined to turn in; leaving orders to my boys, who slept nearer the door, to wake me in case the house was in dauger of falling. But I miscalculated my apathy, for 1 conld not sleep much. The shocks continned at intervals of half an hour or an hour all night, just stroug enough to wake me thoroughly each time and keep me on the alert ready to jump up in case of danger. I was therefore very glad when morning cane. Most of the inhabitants lail not been to bed at all, and some had stayed out of doors all night. For the next two days and nights shocks still continued at short intervals, and several times a day for a week, showing that there was sone very extensive disturbance heneath our portion of the earth's crust. How vast the forces at work really are can only be properly appreciated when, after feeling their effects, we look abroad over the wide expanse of hill and valley, phain and mountain, and thems realize in a slight degree the immense mass of matter heaved and shaken. The sensation produced by an earthyuake is never to be forgotech. We feel ourselves in the grasp of a power to which the wildest fury of the winds and wavss are as nothing; yet the effect is more a thrill of awe than the terror which the more boisterous war of the clememts produces. There is a mystery and an uncertainty as to the anount of danger we incur, which gives greater play to the inagination, and to the inthences of hopne and fear. These remarks apply only to a moderate earthquake. A severe one is the most destructive and the most horrible eatastrophe to which human beings can he: exposed.

A few days after the earthquake I took a walk to Tondino, a large village of about 7,000 inhahitants, situated it the lower end of the lake of the same name. I dined with the Controlleur, Mr. Bensneider, who had been my guide to Tomolón. He had a fine large house, in which he often .eceived visitors; and his garden was the thest for flowers which I had seen in the tropies, although there was nu great variety. It was he who introduced the rose hedges
which give such a charming appearance to the villages; and to him is chiefly due the general neatness and good order that everywhere prevail. I consulted him about a fresh locality, as I found Rurúkan too much in the clouds, dreadfully damp and gloomy, and with a general staguation of bird and insect life. He recommended me a village some distance beyond the lake, near which was a large forest, where he thought I should find plenty of birds. As he was going himself in a few days I decided to accompany him.

After dinner I asked him for a guide to the celebrated waterfall on the outlet stream of the lake. It is situated about a mile and half below the village, where a slight rising ground closes in the basin, and evidently once formed the shore of the lake. Here the river enters a gorge, very narrow and tortuous, along whith it rushes furiously for a short distance and then phanges into a great chasm, forming the head of a large valley. Just above the fall the channel is not more than ten feet wide, and here a few phank are thrown across, whence, balf hid by luxuriant vegetation, the mad waters may be scen rushing beneath, and a few feet farther [hure into the abyss. Both sight and sound are sraml and impressive. It was here that, four years before 1 ny visit, the Governortieneral of the Netherland Indies committed suicide, by leaping into the torrent. 'lhis at least is the general opinion, as he suffered from a painful disense which was supposed to have made him weary of his life. His body was found next day in the strem below.

Unfortunately, no good view of the fall could now be obtained, owing to the quantity of wood and high grass that lined the margins of the precipices. There are two falls, the lower being the most lolty; and it is possible, by a long circuit, to descend into the walley and see thens from below. Were the best pmints of view searched for and rendered accessible, these falls would probably he fround to be the finest in the Arehipelago. The chasm seems to lie of great depth, prolably 500 or 600 feet. Uufortmately I had no time to explore this valley, as I was anxious to devote exery tine day to increasing my hitherto scanty collections.

Just opposite my abode in Rurúkan was the schoolhouse. The schoolmaster was a native, educated by the Missionary at Tomohón. School was hell every morning for about three hours, and twice a week in the evening there was catechising and preaching. There was also a service on Sunday morning. The children were all taught in Malay, and I often heard them repeating the multi-plication-table up to twenty tinnes twenty very grlibly. They always wound up with singing, and if, was very pleasing to hear many of our old palm-tunes in these remote mountains, sung with Malay words. Singing is one of the real blessings which Missionaries introduce among sarage mations, whose mative chants are almost always monotonous and melancinoly.

On catechising evenious the schoolmaster was a great man, preaching and teaching for three hous at a stretch mnch in the style of an English ranter. This was pretty cold work for his auditors, however warming to himself; and I am inclined to think that these native teachers, having acquired facility of speaking and an endless supply of religions platitudes to talk about, rine their hobby rather hard, without muel consideration for their flock. The Missionaries, however, have much to be proud of in this country. They have assisted the Govermment in changing a savage into a civilized community in a wonderfully short space of time. Forty years sugo the country was a widderness, the people naked savages, gartishing their rude houses with human heads. Now it is a garden, worthy of its sweet native name of "Minahasa." Good roads and paths traverse it in cvery direction; some of the finest coffee plantations in the world surmoun the villages, interspersed with extensive rice-fichls more than suffeient for the support of the population.

The prople are now the most industrious, peaceable, and civilized in the whole Archipelago. They are the best clothed, the best housed, the best ferl, and the best educated; and they have made some progress towards a higher social state. I believe there is no example elsewhere of such striking results being prodnced in so short a time-results which are entirely due to the system of government now adopted by the Dutch in their Eastern
possessions. The system is one which may be called a "paternal despotism." Now we Englishmen do not like despotism-we hate the name and the thing and we would rather see people ignorant, lazy, and vieions, than use any but moral force to make them wise, industrious, and good Aud we mereght when we are lequing with men of our own race, and of similar iteas and equal capacities with ourselves. Example and precept, the toree of public opinion, and the slow, but sure spread of cincation, will do everything in time; withont cugenderiug any of those bitter feelings, or prohucing any of that semvility. hypocrisy, and dependence, whell are the sure results of despotic government. But what should we think of a man who should advocate these pinciples of perfect lierdom in a family or a school? We shonld say that he was applying a good reneral pinciple to a case in which the comlitions rendered it inapplicable-the case in which the governed are in an admitted state of mestal inferiurity to those whu grovern them, and are unable to decide what is best for their permanent welare. Children must be subjected to some decree of authority, mul guidnce; ans il properly managed they will cheerfully mbuit to it, heranse they know their own inferiority, and believe their elders are acting solely for their mod. They leam many things the use of which they camot comprehend, and which they would never learn without some moral and sucial if not physical pressure. LIabits of order, of industry, of cleanliness, of respect and obedience, are inculcated by similar means. Children would never grow up into well-behaved and well-educated men, it the same absolute freedon of action that is allowed to men were allowed to them. Under the hest aspect of education, children are sainected to a mild despotism for the good of themselves and of socioty; and their confidence in the wisdom and moolness of those who ordain and apply this despotism, neutralizes the bad passions and degrading feelings, which under less favourable conditions are its general results.

Now, there is not meroly an analogy,-there is in many respects an identity of relation, between master and papil or parent and chith on the one land, and an uncivilized rwe and its civilized rulers on the other. We know for
think we know) that the education and industry, and the common usages of civilized man, are superior to those of savage life; and, as lie becomes acruainted with them, the savare himself admits this. He admires the superior acquirements of the civilized man, and it is with pride that he will adopt such usages as do not interfere too much with his sloth, his passions, or his prejudices. But as the wilfut child or the idle schoolboy, who was never tanght obedience, and never made to do anything which of his own free will he was not inclined to do, would in most alses obtain neither education nor manners; so it is much more unlikely that the savage, with all the confirmed habits of manhood aud the traditional prejudices of race, shonld ever do more than copy a few of the least beneficial customs of civilization, without some stronger stimulus than precept, very imperfectly backed by example.

If we are satisfied that we are right in assuming the government over a snvage race, and occupying their country; and if we further consider it our duty to do what we can to improve our rude subjects and raise them up towards our own level, we must not be too much afraid of the cry of " despotism" and "slavery," but must use the authority we possess, to induee them to do work which they may not altogether like, but which we know to be an indispensable step in their moral and physical advancement. The Duteh have shown much good policy in the means by which they have done this. They have in most cases upheld and strengthened the authority of the native clicts, to whom the people have been accustomed to render a voluntary obedience; and by acting on the intelligence and selfinterest of these chiefs, have brought about changes in the mamers and customs of the people, which would have pxeited ill-fering and perhaps revolt, had they been directly enforeed by foreigners.

In carrying out such a system, much depends upon the character of the people; and the system which succeeds adairably in one place could only be very partially worked out in another. In Minahasa the natural docility and intelligence of the race have made their progress rapid; and how important this is, is well illustrated by the fact, that in
the immediate vicinity of the town of Menado are a trilie called Banteks, of a much less tractable disposition, who have hitherto resisted all efforts of the Duteh Government to induce them to adopt any systematic cultivation. These remain in a ruder condition, but engage themselves will. ingly as ocasional porters and labourers, for which their greater strength and netivity well adapt them.

No doubt the system here sketched, seems open to serious objection. It is to a certain extent despotic, and interferes with free trade, free labour, and free communication. $\Lambda$ mative cannot leave his village without a pass, and cannot engage himself to any merchant or captain without a Government premit, The coffee has ail to be sold to (Govermment, at less than half the price that the local merchant would give for it, and he consequently cries out loudly against "monopoly" and "oppression." He forgets, however, that the coffee plantations were astablished by the Government at great onthy of capital and skill; that it gives free elucation to the people, and that the monopoly is in lieu of taxation. He forgets that the product he wants to parchase and make a protit by, is the creation of the Goverment, withont whom the people would still be savages. lIe linows wery well that free trade would, as its first mosult, leal to the importation of whole cargoes of arrack, whish would bo carried over the conatry and exchanged fir coffer That drunkenness and poverty would spreal over the land; that the puthic coffee phantations would not be kept up ; that the quality and quantity of the coflee would soon deteriome ; that traders and merchants would get rich, but that the people would relapse into powaty and harharism. That such is invariably the result of tret trade with any savage tribes who possess a valuable prodnct, native or cultivated, is well known to those who have visited such people; but we might even anticipate from general principles that evil results would happen. It there is me thing rather than another to which the graml law of continuity or development will aprly, it is to hmman progress. There are certain stages throngh which society must pass in its onward march from barbarism to civilization. Now one of these stages has always been some form or other of despotism, such as
feudalism or servitude, or a despotic paternal government; and we have every reason to believe that it is not possible for humanity to leap over this transition epoch, and pass at once from pure savagery to free civilization. The Dutch system attempts to supply this missing link, and to bring the people on by gradual steps to that ligher civilization, which we (the English) try to force upon them at onee. Our system has always failed. We demoralize tand we extirpate, but we never really civilize. Whether the Dutch systom can permanently succeed is but doubtful, since it may not be possible to compress the work of ten centuries into one; but at all events it takes nature as a guide, and is therefore more deserving of success, and more likely to succeed, than ours.

There is one point connected with this question which I think the Missionaries might take up with great physical and moral results. In this benutiful and healthy conntry, and with abundance of food and necessaries, the population does not increase as it ought to do. I can only impute this to one cause. Infant mortality, produced by neglect while the mothers are working in the plantations, and by general ignorance of the conditions of health in infants. Women all work, as they have always been accustomed to do. It is no hardship to them, but I believe is often a pleasure and relaxation. They either take their infants with them, in which case they leave them in some shady spot on the ground, going at intervals to give them nourishment, or they leave them at home in the care of other children too young to work. Uuder neither of these circumstances can infants be properly attended to, and great mortality is the result, keeping down the increase of population far below the rate which the general prosperity of the country and the universality of marriage would lead us to expect. This is a matter in which the Government is directly interested, since it is by the increase of the population alone that there can be any large and permanent increase in the produce of coflee. The Missionaries should take up the question, because, by inducing married women to contine themselves to domestic duties, they will decidedly promote a higher civilization, and directly increase the health and happiness of the whole community.

The people are so docile, and so willing to adupt the manners and customs of Europeans, that the change might be easily effected, by merely showing them that it was a question of monality and civilization, and an essential step in their progress towards an equality with their white rulers.

After a fortnight's stay at Rurúkan, I left that pretty and interesting village in search of a locality and climate more productive of binds and insects. I passed the evenimg with the Controlleur of Tondeno, and the next morning tu nine, left in a small boat for the head of the lake, a dis. tance of abont ten miles. The lower end of the lake is bordered by swamps and marshes of considerable extent, Lut a little further on the hills come down to the water's edge and grve it very much the appeasance of a great river, the width being abont two miles. At the upper end is the vilhage of Kakas, where I dined with the head man in a good louse like those I have already described; and Here went on to Langówan, four miles distant over a level phain. This was the place where I had been recommended to stay, and I accordingly unpacked my buggage and made: myself comfortable in the lange house devoted to visitors. 1 obtained a man to shoot for me, and another to acconpany me the next day to the forest, where I was in hopes of tinding a good collecting ground.

In the morning after breakfast I started off, but found I had four miles to walk over a wearisome straight road through colfee plantations before I could get to the forest, and as soon as I did so it came on to rain heavily, and did not cease till night. This distance to walk every day was too far for any profitable work, espectally when the weather was so micertain. I therefore decided at once that I must go further on, till I lound some place close to or in a forest country. In the aftemoon my friend Mr. Bensneider arrived, together with the Controlleur of the next district, called Belang, from whom 1 learnt that six miles further on there was a village called l'anghu, which had been recently formed and had a good tleal of forest close to it; and he promised me the use of a small house if I liked to go there.

The next morning I went to see the hot-springs and
mul volcamoes, for which this place is celebrated. A picturesque path among plantations and ravines, brought us to a beataiful circular basin about forty feet diameter, bordered by a caleareous ledge, so uniform and traly surved that it looked like a work of art. It was filled with clear water very near the boiling point, and emitting clouds of steam with a strong sulphurous ohomr. It overflows at one point and forms a litule strem of hot water, which at a hundred yards' distance is still tom hot to hold the land in. A little further on, in a pieco of rough woul, were two wher springs not so regular in outline, but appearing to be mowh hotter, as they weme in a continual state of attive ebullition. At intervals of a few minutes a great escape of stem or gas took place. throwing up a culumn of water three or four feet high,

We then went to the mud-springs, which are about a mile off, and are still more curions. On a sloping tract of ground in a slight loflow is a smatl lake of liquid mud, in patches of blue, red, or white, and in many places boilinu and bubhling most furiously. All around on the indurated clay, are smatl wells and craters full of boiliag mud. These seem to be forming continually, a small hole appearing first, which emits jets ol' steam and boiling mud, whieh on hardening, forms a little cone with a crater in the middle. The ground for some distance is very unsafe, as it is evidently liquid at a small depth, and berds with pressure like thin ice. At one of the smaller marginal jets which I managed to approach, I heh my hand to see il it was really as hot as it looked, when a little drop of mud that spurted on to my finger sealded like boiling water. A short distance off there was a dlat bare surface of rock, as stmooth and hot as an oven floor, which was evidently an old mud-pool dried up and hardened. For hundreds of yards round where there were banks of reddish and white clay used for whitewash, it was still so hot close to the surtace that the hand could havdly hear to be held in sracks a few inches deep, and from which arose a strong sulphureous vapour. I was informed that some years back a French gentleman who visited these suriugs ventured too near the liquid mud, when the crust gave way and he was engulfed in the horrible caldron.

This evidence of intense heat so near the surface over a large tract of country, was very impressive, and I coulil hardly divest myself of the notion that some terrible catastrophe might at any moment devastate the country. Yet it is probable that all these apertures are really safety-valves, and that the inequalities of the resistan' of various parts of the earth's crust, will always prevent such an accumulation of force as would be required f.n upheave and overwheln any extensive area. About sewen miles west of this is a volcano which was in eruption about thirty years before my visit, presenting a magnificent appearance and covering the surrounding country with showers of ashes. The plains around the lake formes by the intermingling and decomposition of voleanic prodhets are of amazing fertility, and with a little management in the rotation of crops might be kept in contintal cultivation. Rice is now grown on them for three or four years in succession, when they are left fallow for the same period, alter which rice or maize can be again grown. Good rice produces thirty-fold, and coffee trees continue bearing abundantly for ten or fifteen years, without any manure and with scatcely any cultivation.

I was dehyed a day by incessant rain, and then pruceeded to Panghu, which I reached just before the daily rain began at 11 A.m. After leaving the summit level of the lake basin, the road is carried along the slope of a tine forest ravine. The descent is a long one, so that 1 estimated the village to be not nore than 1,500 feet above the sea, yet I found the morning temperature often $69^{\circ}$, the same as at Tondano at least 600 or 700 feet higher. I was pleased with the appearance of the place, which had a good deal of forest and wild country around it; and found prepared for me a little house consisting only of a verandah and a back room. This was only intended for visitors to rest in, or to pass a night, but it suited ne very well. I was so unfortunate, however, as to lose both my hunters just at this time. One had been left at Tondáno with fever and diarrhoea, and the other was attacked at Langowan with intinmmation of the chest, and as his case looked rather bad I had him sent back to Menado. The people here were all so busy with their rice-harvest, which it was
important for them to finish owing to the early rains, that I could get no one to shoot for me.

During the three weeks that I stayed at Panghu it rained nearly every day, eitler in the afternom only, or all day long; but there were generally a dew hours sunshine in the morning, and I took advantage of these to explore the roads and $l^{\text {maths, }}$ the rocks and ravines, in search of insects. These were not very abundant, yet I saw enough to convince me that the locality was a grent one, had I been there at the berimuing instend of at the end of the dry season. The notives brought me daily it lew inseets obtaned at the Sagheir palms, including sume tine Cetonias and star-beeties. Two litte hoys were very expert with the blowpipe, and hromst me at mod matns small limds, whicle they shot with pullets of clay, Amoner these was a pretty little flower-pueker of a new speeies (S'rionochilus nureolimbatus'), and several of the loveliest honeysuckers I lual yot seen. My genema collectinn of hirds was, however, almost at a stamstill ; for though I at dength obtained a man to shoot for nus, lie was not $\underline{\text { nombl }}$ for much, and sedom lownoth me nome than one lind a day. The best thing he shot was the large and rare fruitphigeon peruliar to Xorthern Celehos (Carpphara forsteni), which I had long been seeking after:

I was myself very succestul in ome beautifud group of insects, the tiger-lreetles, which semm more aboudant and varied here than anywhere else in the Archipelaro. I first met with them on an cutting in the rond, where a hard clayey bank was partially overymown with mosses ant small ferms. ILere, I found rmming abont, a small olive-green species which never took ilight; and more ramely a fine purplish hlack wingless insect, which was always found motionless in crevices, and was therefore probably nocturnal. It appeareal to me to form a new grenus. About the roads in the forest, I frmat the lavreand handsone Cieindela herws, which I had before ubtainal sparingly at Macassar; hut it was in the monntain torrent of the ravine itself that I mot my finest things. On deand trunks overhanging the water and on the louks and fuliage, I olitained three sery pretty specios of Cicindela, quite distinct in size, form, and colour, lut hawing an almost
identical pattern of pale spots. I also found a single specimen of a most curious species with very long anteunte. But my finest discovery here was the Cicimdela gloriosa, which I found on mossy stones just rising above the water. After obtaining my first specimen of this elergant insect, I used to walk up the stream, watching carefulty every moss-covered rock and stone. It was rather shy, and would often lead me a long chase from stone to stone, becoming invisible every time it settled on the damp moss, owing to its rich velvety green colour. On som. days I could only catch a few glinuses of it, on others I grot a single specimen, aud on a few eccasions two, but never without a more or less active pursuit. This and several other species I never saw but in this one ravine.

Among the people here I saw specimens of several types, which, with the peenliarities of the languages, gives me some notion of their probable orisin. A striking illustration of the low state of civilization of these people till ruite recently, is to be found in the great diversity of their labrages. Villages three or four miles apart have separate dialects, and each group of three or four such villages has a distimet language quite uniatelligille to all the rest; so that, till the recent introduction of Malay by the Missionaries, there must have been a bar to all free commonication. These languages olfer many peculiarities. They contain a Celehes-Malay element and a I'apuan element, along with some radical peculiarities found also in the languages of the siatu and Sanguir ishands further north, and therefore probably derived from the Elilippine lslands. Physieal charaters correspond. There are some of the less civilized tribes which have semi-1apuan features and hair, while in some villages the true Celebes or lugis physiognomy prevails. The platean of Tondano is chicfly inhabited by people nearly as white as the Chinese, and with very pheasing seni-European foutures, The people of Sian and Sanguir much rescmble these, and I believe them to be perhaps immigrants from some of the islands of North Polynesia. The Papuan type will represent the remnant of the aborigines, while those of the Bugis character show the extension northward of the superior Malay races.

As I was wasting valuable time at Panghu owing to the bad weather and the illness of my hunters, I returned to Menado after a stay of three weeks. Here I had a little tonch of fever, and what with drying and packing away my collections and getting fresh servants, it was a fortnight before I was ayain ready to start. í now went eastward over an undulating combry skirting the great volcano of Klablat, to a village ealled Lempas, situated close to the extensive forest that covers the lower slopes of that mountain. My baggage was carried from village to village by relays of men, and as each change involved some delay, I did not reach my destimation (a distance of eighteen miles) till sunset. I was wet through, and had to wait for an hour in an monomortable state till the first instalment of my laggage arrived, which luckily contained my clothes, while the rest did not come in till midnight.

This being the disirict inhalited by that singular animal the Babirusa (Hog-deer) I inquired about skulls, and soon oltained several in tolerable coudition, as well as a fine one of the rare and curions "Sapi-utan" (Auoa depressicornis), Of this animal I had seen two living specimens at Menado, and was surprised at their great resemblance to small cattle, or still more to the Eland of South Africa. Their Malay mame signifies "furest ox," anl they differ from very :mall high-brei oxen principally by the low-hauging dewbap, and straight pointed larms which slope back over the neck. I did not find the forest here so rich in insects as I bad expected, and my hunters got me very few birds, hut what they did obtain were very interesting. Among these were tho rare forest Kingfisher (Cittura cyanotis), a small new species of Merapodins, and one specimen of the harge and interesting Maleo (Megacephalon rubripes), to obtain which was one of my chici reasons for visiting this district. Getting no more, however, after ten days search I removed to Licoupang, at the extremity of the peninsula, a place celclrated for these birds, as well as for the Babinúsa and Sapi-utan. I found here Mr. Goldmam, the eldest son of the Governor of the Moluceas, who was superintending the establishment of some Government saltworks. This was a better locality, and I obtained some
fine butterflies and very good birds, among which was one more specimen of the rare ground dove (Pluegmas tristigmata), which I had first obtained near the Máros waterfall in South Celebes.

Hearing what I was particularly in search of, Mr. Goldmann kindly offered to make a hunting-party to the
 and uninhabited sea-beach about twenty miles distant. The climate here was quite different to that on the roountains, not a drop of rain having fallen for four months; so I made arrangements to stay on the beach a week, in order to secure a grood number of specimens. We weat partly by boat and partly through the forest, accompanied by the Najor or head-man of Licoupang, with a dozen matives aud thout twenty dons. On the way they caught a young sapi-utan and five wild pigs. Of the former I preserved the head. This animal is entively confined to the remote momtain forests of Celebes an? one or two aljacent islauls which form part of the sane group. In the adults the head is black, with a white mark neer each eye, one on each check and amother on the throat. The horns are very smooth and sharp when young, but become thiekser and ridged at the bottom with age. Most naturalists monsider this curious animal to be a small ox, but from the character of the horns, the fine coat of hair and the descenling dewlap, it seemed closely to appronch the antelopes.

Arrived at our destination we built a lant and prepared for a stay of some đays, I to shoot and skin "Maleos," Mr: Goldmann and the Major to hunt wild pigs, Babirusa, and Sapi-utan. The place is situated in the large bay between the islands of Limbé and Panca, and consists of a steep bach more than a mile in length, of deep lonse ani: coarse back voleanic saud or rather gravel, very fatiguing to walk over. It is bounded at each extremity by a small river, with hilly gromd beyond; while the forest behime the beach itself is tolembly level and its growth stunted. We have here probably an ancient lava stream from the Klabat volcano, which has flowed down a valley into the sea, and the decomposition of which has formed the loose black sand. In contirmation of this view it may be men-
tioned, that the beaches beyond the small ivers in botht directions are of white sand.

It is in this loose hot black sand, that those singular birds the "Maleos" deposit their egges. In the months of August and September, when there is little or no rain, they come down in pairs from the interior to this or to one or two other favourite spots, and serateh holes three or four feet deep, just above high-water mark, where the female deposits a single large egro, which she covers over with about a foot of samd, and then returns to the forest. At the end of ten or twelve days she comes again to the same spot to lay another egs, aml when female bird is suppused to lay six or eight eags during the season. The male assists the female in making the lole, coming down and returning with her. The appearance of the bide when walking on the beach is very handsome. The glossy black and rosy white of the plumage, the helmeted head and eievated tail, like that of the common fowl, give a striking character, which their stately and somewhat sedate walk renders still more remarliable. There is hardly any difference between the sexes, except that the casque ot bonnet at the back of the head and the tubercles at the nostrils are a little larger, and the beatiful rosy salmon colour a bittle deeper in the male bird, bat the difference is so slight that it is not always possible to tell a mate from a femate withont dissection. They run quickly, but when shot at or sudulenly disturved take wing with a heavy noisy flight to some neighbouring tree, where they settle on a low branch; and they pobably roost at night in a similar situation. Many birds lay in the same hole, for a dozen eggs are often found together; and these are so large that it is not possible for the body of the bird to contain more than one fully-developed eqger at the same time. In all the female bids which I shot, none of the eggs besides the one large one exceded the size of peats, and there were only eight or nine of these, which is $1^{\text {ru- }}$ bably the extreme number a bird can lay in one season.

Every year the natives come for filty miles round to obtain these eggs, which are estemed a reat delicacy, and when quite fresh are indeed delicious. They are richer than hens' eggs and of a finer llavour, and each one
completely fills an ordinary teacup, and forms with bread in rice a very good meal. The colour of the shell is a pale lurick red, or very rarely pure white. They are elougate and very slightly smaller att one end, from four to four and a half inches long by two and a quarter or two and a half wide.

After the eggs are deposited in the sand they are no further cared for by the mother. The young birds on breaking the shell, work their way up through the sand and run off at once to the forest; and I was assured by Mr. Duivenboden of Temate, that they can fly the very day they are hatehed. IIe had taken some eggs on board his schooner which hatched during the night, and in the moming the Jittle lirds flew readily across the eabin. Considering the great distances the birds come to deposit the eggs in a proper situation (olten ten or fitteen miles) it srems extraordinary that they should take no further care of them. It is, however, quite certain that they neither do nor can watela them. The eggs being deposited by a number of hens in succession in the same hole, would remer it impossible for each to distinguish its own; and the food necessary for such large birds (consisting eutirely of fallen fruits) can only be obtained by roaming over an extensive district, so that if the numbers of hirds which come down to this single beach in the brecing seasm, amounting to many humireds, were obliged to remain in the vicinity, many would perish of hunger.

In the structure of the feet of this bird, we may detect a cause for its departing from the habits of its nearest allies, the Megapordii and Talegalli, which heap up earth. leaves, stones, and sticks into a huge mound, in which they hury their cegrs. The feet of the Mateo are not nearly sin targe or strong in proportion as in these birds, while its - laws are short and straight instead of being long and much curved. The toes are, however, strongly webbed at the base, forming a broal powertul foot, which, with the rather long leg, is well adapted to scratel away the loose sand (which flies up in a pertect shower when the birds are at work), lut which could not without much labour accummlate the heaps of miscellancous rubbish, which the large grasping feet of the Megapodius bring together with ease.

We may also, I think, see in the peenling ormaization of the entire family of the Meqapodide or Brush Turkers. a renson why they depart so widely from the nsinal lalists of the Class of birds. Each egg being so large as entirely to fill up the abdominal cavity and with diffendy pass the walls of the pelvis, a considerable interval is requirer before the successive ergs can be matured (Homatives say rbout thirteen daysi. Each hirid hays six or eight eqges or even more each seatom, so that betwern the first and last there may be an interval of two or three nuonths. Now, if these eggs were hatehed in the oxlinaty waz, either the parents must keep sitting contimally for this bous period, or if they only beran io sit atter the last erg was deposited, the first would lue exposed to injury by the climate, or to destruction by the lapere lizards, suakes, or other animals which abount in the diatriet; becanse such larete birds must roam about a grood deal in seareh of food. Here then we seem to have a case, in which the habits of a bind may be directly traced to its exceptional organzation: for it will hardly be mantamed that this abnomal structure and peculiar food ware given to the Megapoditar, in order that they might mot exhibit that parental affection, or possess those domestic instinets so genema in the Class of birds, and which so much excite our admitation.

It has generally been the custom of writers on Natural Fistory, to take the hatoits and instincts of animals as fixed points, and to consider their structure and orsmization as specially adapted to be in acemrdance with these. This assumption is however an arbitrary one, and has the had effect of stilling incuiry into the nature and causes of "instincts and labits," treation them as directly due to a "first cause," and therefore incomprehensible to us. I believe that a careful consideration of the structure of a species, and of the peculiar physical and orgmic conditions by which it is suroumded, or las been surrounded in past ages, will often, as in this case, throw much light on the origin of its habits and instincts. These again, combined with changes in external conditions, react upon structure, and by means of "variation" and "natural selection" both are kept in harmony.

My friends remained three days, and got plenty of wild
pigs and two Anoas, but the latter were much injured by the dogs, and I could only preserve the heals. A grand hunt which we attempted on the third day failed, owing to had management in driving in the game, and we waited for five hours perched on platforms in trees without getting a shot, although we lad been assured that pigs, Babirisas, and Anóas would rush past us in duzens. I myself, with two men, stayed three days longer to get nore specimens of the Maleos, and succeded in preserving twenty-six very fine ones; the flosh and egrgs of which supplied us with abundance of grood food.

The Majwr sent a hoat, as he had promised, to take home my bargrage, while I walked through the forest with my two boys and a guide, about fourteea miles. For the first half of the distance there was no path, and we had often to cut our way throngh tangled rattans or thickets of hamboo. In some of our turnings to tind the most practicable ronte I exprosed iny fear that we were losing our way, as the sum being vertical I coukd see no possible clue to the right direction. My conductors, however, langhed at the iden, which they seemed to consinler quite ludicrous; and sure enough, about half way, we sudilenly encountered a little hut where people from Licoupang came to hunt and smoke wild pigs. My guide told me lae had never hefore traversed the forest between these two points; and this is what is considered by some travellers as one of the savade "instincts," whereas it is merely the result of wide greneral knowledge. The man knew the tupography of the whole district; the slope of the land, the direction of the streams, the belts of bambon or rattam, and many other indications of locality and direction ; and he was thus enabled to hit straight upon the hat, in the vicinity of which he had often lanted. In a forest of which he knew nothing, he would he quite as much at a loss as a Enropean. Thus it is, I am convinced, with all the wonderful accounts of Indians finding their way through trackless forests to definite points. They may never have passed straight between the two particular points before, but they are well acquainted with the vicinity of both, and have such a general knowledge of the whole country, its water system, its soil and its vegetation, that as they appronch the point
they are to reach, many easily-recognised indications enable them to hit upon it with certainty.

The chief feature of this forest was the abundance of mattan palms, hanging from the trees, and turning and twisting about on the ground, often in inextricable confusion. One wonders at first how they can get into such queer shapes; but it is evidently caused by the decay and fall of the trees up which they have first climbed, after which they grow along the ground till they meet with another trunk up which to ascend. A tangled mass of twisted living rattan, is therefore a sigu that at some former period a large tree las fallen there, thongh there may be not the slightest vestige of it left. The rattan seems to have unlimited powers of growth, and a single plant may mount, up several trees in succession, and thus reach the enormons length they are said sometimes to attain. They much improve the appearance of a forest as seen from the coast; for they vary the otherwise monotonous tree-tops with feathery crowns of laves risiug clear above them, and each terminated by an erect leafy spike like a light-ning-conductor.

The other most interesting olject in the forest was at beautiful palm, whose ferfectly snmoth and cylindrical stem rises erect to more than a hundred feet high, with a thickness of only eight or ten inches; while the litnshaped leaves which compose its ennm, are almost complete circles of six or eight feet dianster, bome alote on long and slender petioles, and beantifilly toothed round the edge by the extremities of the leaflets, which are separated only for a few inches from the circumference. It is probably the Livistona rotundiluliat of intanists, and is the most complete and beautiful fam-leaf I have ever seen, serving admirably for folding into water-buckets and impromptic baskets, as well as for thatching and other purposes.

A few days afterwards I returned to Menado on horseback, sending my baggage round by sea; and had just time to pack up all my collections to go by the next mail steamer to Amboyna. I will now devote a fuw pages to an account of the chief peculiarities of the Zoolngy of Celebes, and its relation to that of the surrounding emptries.

## CHAPTER XVIIL.

## NATURAL HISTORY OF CELEBES,

$T$ WE position of Celebes is the most central in the Archipelago. Immediately to the north are the Philippine islands; on the west is Bomeo; on the east are the Molucea islands; and on the south is the Timor group: and it is on all sides so comnected with these islands hys its own satellites, by small islets, and by coral reefs, that mether by inspection on the map no by actual obsemation around its coast, is it possible to detemine accurately which should he grouped with it, and which with then surrounding distriets. Such heing the case, we shonh maturally expeet to find, that the productions of this central island in some degree represented the richmess and variety of the whole Arehigelago, while we should not expert much intividuality in a country, so sithated, that it would seem as if it were preeminently ditted to receive stragglem and immigrants from all around.

As so often happens in nature, however, the fact tums out to be just the reverse of what we should have expected; and an examination of its animal productions, shows Crlebes to be at once the poorest in the number of its species, and the most isolated in the character of its productions, of all the great islands in the Archipelago. With its attendent islets it spreads over an extent of sea lardly inferior in lengti and breadth to that oceupied by Borneo, while its actual land area is nearly double that of Java; yet its Mammalia and terestrial hirds number scarcely more than half the species found in the lastnamed island. Its position is such that it could receive immigrats from every site more readily than Java, yet in proportion to the species which inhabit it far fewer seem derived from other islands, while far more are altugether peculiar to it ; and a considerable number of its animal forms are so remarkable, as to find no close allies in uny other part of the world. I now propose to examine
the best known rroups of Celebesian anmals in sotme detail, to stmly their relations to those of other islambs, and to call attention to the many points of interest whicls they surgest.

We know far more of the birds of Celehes thatn we do of any other group of animals. No lusis than 191 spermen have been discovered, and thoun no doubt many mor: wading and swimming bides have to he mherl, yet that hat of land bides, 144 in manler, and whoh for our prestat purpuse are much the most important, nust bo very nearly complete. I myseli assiduonsly edlemed birds in Celebsis for nenty ten months, and my assistant, Mr. Mlem, subt two months in the sula islames. Thu Dutch matmalist Forsten spent two years in Northern Crdebes (twonty years before my visit), and collections of bivels had also Bren sent to Hhllanl from Macassar. The French shitu of discurery, hiAstrolube, also touchen at Menado and procured coldections. Since my return home, the Inath naturalists Imsenhery and Bernstein have made externsive wollections bouh in North Celebes and in the Sula islands: yet all their wasarehes combined, have only added aight species of land binds to those formias part of my own "ohlection-a fict which renders it alnost certain that there are very few more to discover.

Besides salayer and Boutong on the south, with Peling and Pangry on the east, the three islands of the sula (or Zula) Arehipelago also beloner zoolugically to Culehes, athourh their pusition is such, that it would seem more matural to gromp them with the Moluccas. Alout 48 Lamd birds are now known from the Sula group, and it we rejuet from these, five species which have a wide range over the Archipelate, the remainder are muth nore characteristic of Culehes than of the Moluccas. Thirty-one species whe Identieal with those of the fomer ishame, and four are: representatives of Colehes forms, while only eleven ane Moluccan species, and two nore representatives.

But although the sula islands belong to Celebes, they aro so cluse to Bouru and the southern islands of the Giloun group, that several purely Moluccan forms have migtatert there, which are quite unknown to the island of Celebes itself; the whole thirteen Moluccan species being in this
category, thus adding to the productions of Celebes a foreign element which does not really belong to it. Iu sturlying the peculiarities of the Celebesian faum, it will therefore be well to consider ouly the productions of the main island.

The number of land birds in the island of Celebes is 128, and from these we may, as before, strike out a small number of species which roam over the whole Archipelago (often from India to the Pacific), and which therefore only serve to disguise the peculiarities of individual islands. These are 20 in number, and leave 108 speecies which we may consider as more especially characteristic of the island. On accurately comparing these with the birds of all the surrounding countries, we find that only nine extend into the islands westward, and nineteen into the islands eastward, while no less than 80 are entirely confined to the Celebesian fauna-a degree of individuality, which, considering the situation of the island, is hardly to be equalled in any other part of the world. If we still more closely examine these 80 species, we shall be struck by the many peculiarities of structure they present, and by the curious aflinities with distant parts of the world which many of them seem to indicate. These points are of so much interest and importance that it will be necessary to pass in review all those species which are peculiar to the island, and to call attention to whatever is most worthy of remark.

Six species of the Hawk tribe are peculiar to Celebes; three of these are very distinet from allied birds which range over all India to Java and Borneo, and which thus seem to be suddenly changed on entering Celebes. Another, (Accipiter trinotatus) is a beantiful hawk, with elegant rows of large round white spots on the tail, rendering it very conspicuous and quite different from any other known bird of the family. Three owls are also peculiar; and one, a barn owl (Strix rosenbergii), is very much larger and stronger than its ally Strix javanica, which ranges from India through all the islands as far as Lombock.

Of the ten Parrots found in Celebes, eight are peculiar. Among them are two species of the singular mquet-tailed parrots forming the genus Prioniturus and which are
characterised by possessing two long spoon-shaped feathers in the tail. Two allied species are found in the adjacent island of Mindanno, one of the Philippines, and this form of tail is found in no other parrots in the whole world. A small species of Loriket (Trichoglossus flavoviridis) seems to have its nearest ally in Australia.

The three Woodpeckers which inhabit the island are all peculiar, and are allied to species found in Java and Borneo, although very different from them all.

Among the three peculiar Cuckoos two are very remarkable. Phonicophans callirhynchus is the largest and handsomest species of its genus, and is distinguished by the three colours of its beak, bright yellow, red, and black. Eudynamis melanorynchus differs from all its allies in having a jet-black bill, whereas the other species of the genus always have it green, yellow, or reddish.

The Celebes Roller (Coracias temmincki) is an interesting example of one species of a genus heing cut off from the rest. There are species of Coracias in Lurope, Asin, and Africa, but none in the Malay peninsula, Sumatra, Java, or Borneo. The present species seems therefore quite out of place; and what is still more curious is the fact, that it is not at all like any of the Asiatic species, but seems more to resemble those of Africa.

In the next fanily, the Bee-eaters, is another equally isolated bird, Meropogon forsteni, which combines the characters of African and Indian Bee-eaters, and whose only near ally, Meropogon breweri, was discovered by M. Du Chaillu in West Africa!

The two Celebes Hormbills have no close allies in those which abound in the surrounding countries. The only Thrush, Geocichla erythronota, is most nearly allied to a species peculiar to Timor. Two of the Flycatchers are closely allied to Indian species which are not found in the Malay islands. Two genera somewhat allied to the Magpies (Streptocitta and Charitornis), but whose affinities are so doubtful that Professor Schlegel places them among the Starlings, are entirely confined to Celebes. They are beautiful long-tailed birds, with black and white plumage, and with the feathers of the head somewhat rigid and scalc-like.

Doubtfully allied to the Starlings are two other very isolated and heautiful birds. One, Enoles erythrophrys, has ashy and yellow plumage, but is ornamented with broad stripes of orange-red above the eyes. The other, lasilornis celebensis, is a blue-black bicd with a white patch on each side of the breast, and the hatad ormanented with a beautiful compressed scaly crest of leathers, resembling in form that of the well-known Cock-of-the-rock of Soutla America. The onby ally to this bird is found in Ceram, and has the feathers of the crest elongated upwards into quite a different form.

A still more curious bird is the Scissirostrum parei, which although it is at present classed in the Starling frunily, differs from all other species in the form of the bill and nostrils, and seems most nearly allicd in its general structure to the Ox-peckers (Buphara) of tropical Africa, next to which the celebrated ornithologist Prince Bonaparte finally placed it. It is almost entively of a slaty colour, with yellow bill and feet, but the feathers of the rump and upper tail-coverts each terminate in a rigid alossy pencil or tuft of a vivid crimson. These pretty little birds take the place of the metallic-green starlings of the genus Calomis, which are found in most other islands of the Archipelago, but which are absent from Celebes. They go in tlocks, feeding upon grain and fruits, often frequenting dead trees, in holes of which they build their nests; and they cling to the trunks as easily as woodpeckers or creepers.

Ont of eighteen Pigeons found in Celebes cleven are peculiar to it. Two of them, Ptilonopus qularis and Turacana menadensis, have their nearest allies in Timor. Two others, Carpophaga forsteni and Phsegenas tristigmata, most resemble Philippine island species; and Carpophaga radiata belongs to a New Guinea group. Lastly, in the Gallinaceous tribe, the curious helmeted Maleo (Megacephalon rubripes) is quite isolated, having its nearest (but still distant) allies in the Brush-turkeys of Australia and New Guinea.

Judging, therefore, by the opinions of the eminent naturalists who have deseribed and classified its birds, we find that many of the species have no near allies whatever
it the countries which surronnd Celobes, but are either quite isolated, or indicate relations with such distant regions as New Guinea, Australia, India, or Africa. Other cases of similar remote allinities betwren the productions of distant countries no doult exist, but in no spot upon the globe that I am yet aequainted with, do so many of then oceur torether, or do they form so deeided a feature in the natural listory of the country.

The Mammalia of Celebes are very fow in number, consisting of furteen terrestrial species and seven bats. or the former no less than eleven are peculiar, including two which there is reason to believe may have been recently caried into other islands by man. Three species which have a tolerably wide range in the Archipelago, are1, The curions Lemur, Tursius spectrum, which is found in all the islands as far westward as Malacea; 2, the common Malay Civet, Viverra tangalunga, which has a still wider range; and 3, a Deer, which seems to be the same as the liusa hippelaphus of Java, and was probably introduced by man at an early period.

The more characteristic species are as follow :-
Cynopitheeus nigrescens, a curious baboon-like monkey if not a true baboon, which abounds all over Celebes, and is found nowhere else but in the one small island of Batchian, into which it has probably been introduced accidentally An allied species is found in the Philippines, but in no other island of the Archipelago is there anything resembling them. These creatures are about the size of a spaniel, of a jet-black colour, and have the projecting dog-like muzale and overhanging brows of the baboons. They have large red callosities and a short fleshy tail, scarcely an inch long and hardly visible. They go in large bands, living chiefly in the trees, but often descending on the ground and robbing gardens and orchards.

Anon depressicornis, the Sapi-utan, or wild cow of the Malays, is an animal which has been the cause of much controversy, as to whether it should be classed as ox, buffulo, or antelope. It is smaller than any other wild cattle, and in many respects seems to approach some of the ox-like antelopes of Africa. It is found only in the mountains, and is said never to inbabit places where there
are deer. It is somewhat smaller than a small Highland cow, and has long straight horns, which are ringed at the base and slope backwards over the neek.

The wild pig seems to be of a spectes peculiar to the islaud ; but a mueh more curions mimal of this lamily is the Babirusia or P'ig-leer, so maned by the Matays from its bong and slenler legs, and curved tusks resemblius horns. This extraordinary ereature resemhles a pig in gemeral appearauce, but it dous not dig with its snout, as

sरyll of babinuba.
it feeds on fallen fruits. The tusks of the lower jaw the very long and sharp, but the upper ones instead of growing downwards in the usual way are completely reversed, growing upwards out of bony sockets through the skin on each sille of the snout, curving hackwards to near the eyes, and in old animals often reaching eight or ten inchus in leugth. It is difficult to understand what can be the
use of these extriordinary horn-like tecth. Some of the old writers supposed that they served as hooks, by which the creature could rest its head on a branch. But the way in which they upsually diverge just over and in front of the eye has sugrested the more probable idea, that they serve to guard these organs from thorns and spines, while lounting for fallen fruits among the tangled thickets of rattans and other spiny plants. Even this, however, is not satisfactory, for the female, who must seek her food in the same way, does not possess them. I should he inclined to believe rather, that these tusks were once useful, and were then wonn down as fast as they grew ; hut that changed conditions of life have rendered them unnecessary, and they now develop into a monstrous form, just as the incisors of the Beaver or Labhit will go on growing, if the opposite teeth do not wear them away. In old animals they reach an enormous size, and are generally broken off as if by fighting.

Here again we have a resemblance to the Wart-hogs of Africa, whose upper canines grow outwards and curve up so as to form a transition from the usual mode of growth to that of the Babirusa. In other respects there seems no affinity between these animals, and the Babirusa stands completely isolated, having no reselublance to the pigs of any other part of the world. It is found all over Celebes and in the Sula islands, and also in Bonra, the only spot beyond the Celebes group to which it extends; and which island also shows some affinity to the Sula islands in its birds, indicating perhaps, a closer connexion between them at some former period than now exists.

The other terrestrial mammals of Celebes are, five species of squirrels, which are all distinct from those of Java and llorneo, and mark the furthest eastward range of the genus in the tropics; and two of Eastern oprosums (Cuscus), which are different from those of the Moluceas, and mark the furthest westward extension of this gents and of the Marsupial order. Thus we see that the Mammalia of Celebes are no less individual and remarkable than the birds, since three of the largest and most interesting species have no near allies in surrounding countries, but seem vaguely to indicate a relation to the African continent.

Many groups of insects appear to be esperially subject to local influences, their forms and colours changing with cach change of conditions, or even with a change of locality where the conditions seem ahmost identiab. We should therefore anticipate that the individuality manifested in the higher animals would be still more prominent in these creatmes with less stable organisms. On the other hatod, however, we have to consider that the dispersion and migration of insects is much more easily effected than that of manmals or even of hirds. They are much more likely to be carried away by violent winds; their egres may be carried on leaves either by storms of wind or by floating trees, and their larya and pupe, olten buried in trunks of trees or enclosed in waterproof cocoons, may be floaten for days or weeks uninjured over the ocean. These facilities of distribution tend to assimilate the productions of adjacent lands in two ways: first, by direct mutnal interchange of species; and sceondly by rpented immigrations of fresh individuals of a species common to other" islands, which by intercrossing, tend to obliterate the changes of form and colour, which difierences of conditions might otherwise produce. Bearing these facts in mind, we shall tind that the individuality of the insects of Celehes is even greater than we have any reason to expect.

For the purpose of insuring accurncy in comparisons with other islands, I shall confine myself to those gromps which are best known, or which I have myself carefully studied. Beminning with the lapilionide or Swallowtailed butterflics, Celebes possesses 24 species, of which the large mumber of 18 are not found in any other island. If we compare this with bomeo, which out of 29 sjecies has only two not found elsewhere, the difference is as striking as anything can be. In the family of the Pieride, or white butterlies, the difference is not quite so great, owing perhaps to the more wandering habits of the group; but jt is still very remarkable. Ont of 30 species inhabiting Celebes, 19 are peculiar, while Java (from which more species are known than from Sumatra or Borneo), out of 37 species has only 13 peculiar. The Danaida are large, but weak-flying buttertlies, which frequent forests and gardens, aud are plainly but often very richly coloured.

Of these my own collection contains 16 species from Celebes and 15 from Borneo; but whereas no less than 14 are confined to the former island, only two are peculiar to the latter. The Nymphalide are a very extensive group, of generally strong-winged and very bright-coloured battertlies, very abundant in the tropics, and represented in our own country by our Fritillaries, our Vanessas, and our Purple-emperor. Some months ago I drew up a list of the Eastern species of this group, including all the now ones discovered by myself, and arrived at the following comparative results:-

The Coleoptera are so extensive that few of the groups have yet been carefully worked out. I will therefore refer to one only, which I have myself recently studied-the Cetoniade or Rose-chafers,-a group of beetles which, owing to their extreme beauty, lave been much sought after. From Java 37 species of these insects are known, and from Celebes only 30 ; yet only 13 , or 35 per cent., are peculiar to the former island, and 19 , or 63 per cont., to the latter.

The result of these comparisons is, that although Ce lebes is a siugle large ishand with only a few smaller ones closely grouped around it, we must really consider it as forming one of the great divisions of the Archipelago, equal in rank and importance to the whole of the Moluccan or Philippine groups, to the Papuan islands, or to the IndoMalay islands (Java, Sumatra, Borneo, and the Malay peninsula). Taking those families of insects and birds which are best known, the following table shows the comparison of Celebes with the other groups of islands:-

These large and well-known fanilies well represent the general character of the zoology of Celebes; and they show that this island is really one of the most isolated portions of the Archipelago, although situated in its very centre.

But the insects of Celebes present us with other phenomena more curious and more diffieult to explain than their striking individuality. The butterlies of that island are in many cases characterised by a peculiarity of outline, which distinguishes them at a glance from those of any other part of the world. It is most strongly manifested in the Papilios and the Pieridæ, and consists in the forewings being either strongly curved or abruptly bent near the base, or in the extremity being elongated and often somewhat hooked. Out of the 14 species of Papilio in Celebes, 13 exhibit this peculiarity in a greater or less degree, when compared with the most nearly allied species of the surrounding islands. Ten species of Pieride have the same character, and in four or five of the Nymphatidae it is also very distinctly marked. In almost every case the species found in Celebes are much larger than those of the islands westward, and at least equal to those of the Moluccas, or even larger. The difference of form is however the most remarkable feature, as it is altogether a new thing for a whole set of species in one country, to differ in exactly the same way from the corresponding sets in all the surrounding countries; and it is so well marked, that without looking at the details of colouring, most Celebes Papilios and many Pieride, can be at once distinguished from those of other islands by their form alone.

The outside figure of each pair here given, shows the exact size and form of the fore-wing in a butterfly of Celebes, while the inner one represents the most closely allied species from one of the aljacent islands. Figure 1 shows the strongly curved margin of the Celebes species, l'apilio gigon, compared with the much straighter margin of Papilio demolion from singapore and Java. ligure 2 shows the abrupt bend over the base of the wing in Papilio miletus of Celebes compared witls the slight curvature in the common Papilin sarpedon, which has almost exactly the same form from India to New Guinea and

Australia. Figure 3 shows the elongated wing of Taclyyris zarinda, a native of Celebes, compared with the much shorter wing of Tachyris nero, a very closely allied species found in all the western islands. The difference of form is in each case sufficiently obvious, but when the insects

thenselves are compared it is much more striking than in these partial outlines.

From the analogy of birds, we should suppose that the pointed wing gave increased rapidity of flight, since it is a character of terus, swallows, falcons, and of the swiftflying pigeous. A short and rounded wing, on the other hand, always accompanies a more feeble or more laborius
flight, and one much less under command. We might suppose, therefore, that the butterflies which possess this peculiar furm were better able to escape pursuit. But there seems no unusual abundance of inseetivorons birds to render this necessary; and as we cannot believe that such a curious peculimity is without meaning, it seems probable that it is the result of a former condition of things, when the island possessed a much richer faum, the relics of which we see in the jsolated birds and Mammalia now inhabiting it: and when the abundance of insectivorous creatures, rendered some unusual means of escape a necessity for the large-winged and showy butterflics. It is some confirmation of this view, that neither the very small nor the very obscurely coloured groups of butterflies lave elongated wings, nor is any moditication perceptible in those strong-winged groups which already possess grat strength and rapidity of flight. These were alrendy sufficiently protected from their enemies, and did not requive increased power of escaping from them. It is not at all clear, what effeet the peculiar curvature of the wings las, in modifying flight.

Another eurious feature in the zoology of Celebes is also worlhy of attention. I allude to the absence of several groups which are found on both sides of it, in the Indo-Malay islands as well as in the Moluccas; and which thus seem to be unable, from some unknown cause, to obtain a footing in the intervening island. In Birds we have the two families of Podargide and Laniade, which mange over the whole Arehipelago and into Anstralia, and which yet have no representative in Celebes. The genem Ceyx among Kingfishers, Criniger among Thrushes, Rhipidura among Flycatchers, Calomis among Starlings, and Erythura among Finches, are all found in the Moluccas as well as in Borneo and Java,-but not a single species belonging to any one of them is found in Celebes. Among iusects, the large genus of liose-chafers, Lomaptera, is found in every country and island between India and New Guinea, except Celebes. This unexpected absence of many groups, from one limited district in the very centre of their area of distribution, is a phenomenon not altogether unique, but, I believe, nowhere so well marked as in this case; and it
certainly adds considerably to the strauge character of this remarkable island.
The anomalies and eccentricities in the natural history of Celebes which I have endeavonred to sketch in this chapter, all point to an origin in a remote antiquity. The listory of extinct amimals teaches us, that their distribiotion in time and in space are strikingly similir. The rule is, that just as the productions of adjacent areas usually resemble each other closely, so do the productions of successive periods in the same area; and as the productions of remote areas generally differ widely, so do the productions of the same area it remote epochs. We are therefore led irresistibly to the conclusion, that chauge of species, still more of generic and of family form, is a matter of time. But time may have led to a change of species in one country, while in another the forms have been more permanent, or the change may have gone on at an equal rate but in a different manner in beth. In either case the amount of individuality in the productions of a district, will be to some extent a measure of the time that district has been isolated from those that surround it. Judged by this standard, Celebes must be one of the oldest parts of the Archipelago. It probably dates from a period not only anterior to that when Borneo, Java, and Sumatra were separated from the continent, but from that still more remote epock when the land that now constitutes these islands had not risen above the ocean. Such an antiquity is necessary, to account for the number of animal forms it possesses, which show no relation to those of India or Australia, but rather with those of Africa; and we are led to speculate ou the possibility of there having once existed a continent in the Indian Ocean which might serve as a bridge to connect these distant countries. Now it is a curious fact, that the existence of such a land has been already thought necessary, to account for the distribution of the curious Quadrumana forming the family of the Lemurs. These have their metropolis in Madagascar, but are found also in Africa, in Ceylon, in the peniusula of India, and in the Malay Archipelago as far as Celebes, which is its furthest eastern limit. Dr. Sclater has proposed for the hypothetical continent connecting these distant points, and whose former existence is
indicated by the Mascarene islands and the Maldive coral group, the name of Lemuria. Whether or no we believe in its existence in the exact form lere indicatell, the stadent of geographical distribution mast see in the extraordinary and isolated productions of Celebes, proofs of the former existence of some continent from whence the ancestors of these creatures, and of many other intermediate forms, could have been derived.

In this short sketch of the most striking peculiarities of the Natural Itistory of Celebes, 1 have been obliged to enter much into details that I fear will have leen uninteresting to the general reader, but unless I had done so my exposition would have lost much of its force and value. It is by these details alone, that I lave been able to prove the umusual features that Celebes presents to us. Situated in the very midst of an Archipelago, and closely hemmed in on every side hy islands teeming with varied formis of life, its productions have yet a surprising amount of individuality. While it is poor in the actual number of its species, it is yet wouderfully rich in peculiar forms; many of which are singular or beautiful, and are in some cases alsolutely unique upon the globe. We behold here the curious phenomenon, of groups of insects changing their ontline in a similar manner when compared with those of surrounding islands, suggesting some common cause which never seems to have acted elsewhere in exactly the same way. Celebes, therefore, presents us with a most striking example of the interest that attaches to the study of the geographical distribution of animals. We can see that their present distribution upon the globe is the result of all the more reeent changes the earth's surface has undergone; and by a careful study of the phenomena we are sometimes able to deduce approximately what those past changes must have been, in order to produce the distribution we finul to exist. In the comparatively simple case of the Timor group, we were able to deduce these changes with some approach to certainty. In the much more complicated case of Celebes we can only indicate their general nature, since we now see the result, not of any single or recent change only, but of a whole series of the later revolutions which have resulted in the present distribution of hand in the Eastern Hemisphere.

## CHAPTER XIX.

BANDA.

(Deoemder 1857, May 1859, apRLL 1861.)

TIIE Dutch mail steamer in which I travelled from Macassar to Banda and Amhoyna was a roomy and comfortable vessel, although it would only go six miles an hour in the finest weather. As there were lut three passengers besides myself, we had abundance of room, and I was able to enjoy a voyage more than I had ever done before. The arrangements are somewhat diflerent from those on board English or Indian steamers. There are no cabin servants, as every cabin passenger invariably brings his own, and the ship's stewards attend only to the saloon and the rating department. At six A.m. a cup of tea or coffee is provided for those who like it. At seven to eight there is a light breakfist of tea, ergs, sardines, \&c. At ten, Madeira gis and litters are brought on deek as a whet for the substantial eleven o'clock breakfast, which differs from at dinner only in the absence of soup. Cups of tea and coflee are brought round at three P.M. ; bitters, \&e. again it five, a gool diuner with beer and claret at half-pastion, concluded by tea and coffee at eight. Between whiles beer and sodawater are supplied when entled for, so there is no lack of little gastronomical excitements to while away the tedium of a sea voyage.

Our first stopping place was Coupang, at the west end of the large island of Timor. We then coasted along that island for several hundred miles, having always a view of hilly ranges covered with scanty vegetation, rising ridge behind ridge to the height of six or seven thousand feet. Turning off towards Banda we passed Pulo-Cambing, Wetter, and Roma, all of which are desolate and barren volcanic islands, almost as uninviting as Aden, and oftering a strange contrast to the usual verdure and luxuriance of the Archipelago. In two days more we reached the volcanic group of Banda, covered with an unnsually dense
and brilliant green vegetation, indicating that we had phissed beyond the range of the hot dry winds from the If ins of Central Austratia. Banda is a lovely little spot, its three jslauls enclosing a secure harbour from whence no outlet is visible, and with water so transparent, that living corals and even the minutest objects are plainly sem on the voleanic satul at a depth of seven or eight fuhoms. The ever smoking volcano rears its bare cone on one side, while the two larger islands are clothed with vegetation to the summit of the hills.

Going on shore, I walked up a pretty path which leats to the highest point of the island on which the town is situated, where there is a telegraph station and a magnificent view. Delow lies the little town, with its neat redtiled white houses and the thatched cottages of the natives, bounded on one side by the old Portuguese fort. Beyond, about half a mile distant, lies the larger island in the shape of a horseshoe, formed of a range of abrupt hills covered with fine forest and nutmen gardens; while close "pposite the town is the volcano, forming a nearly perfect cone, the lower part only covered with a light green bushy vegetation. On its north side the outline is more uneven, and there is a slight hollow or chasm abont one-fifth of the way down, from which constantly issue two columns of swoke, as well as a good deal from the rugged surface around and from some spots nearer the summit. A white ettlorescence, probably sulphur, is thickly spread over the upper part of the mountain, marked by the narrow black vertical lines of water gullies. The smoke unites as it ri n's, and forms a dense cloud, which in calm damp weather spreads out into a wide canopy hiding the top of the mountain. At night and early morning it often rises up straight and leaves the whole outline clear.

It is only when actually gazing on an active volcano that one can fully realize its awfulness and grandeur. Whence comes that inexhaustible fire whose dense and sulphureous smoke for ever issues from this bare and desolate peak? Whence the mighty forces that produced that peak, and still from time to time exhibit themselves in the earthquakes that always oceur in the vicinity of voleanic veuts? The knowledge from childhood, of the fact that
voleanoes and earthquakes exist, has taken away somewhat of the strane and exeptional character that really helongs to them. The inhabitant of most parts of not inem Europe, sees in the earth the amblem of stability and repose. II is whole life-experience, and that of all his age and generation, teaches him that the earth is solid and firm, that its massive rocks may contain water in alhmanace but never live; and these essential characteristics of the earth are manifest in every mountain his country contains. $A$ voleano is a fact opposed to all this mass of experience, a fret of so awful a chanacter that, if it were the rule instead of the exception, it would make the earth urinhabitable, a finct so strange and maccountahle that we may be sure it would not be beliured on any haman testimony, if presented to us now for the first time, as a natural phemomenom happening in a rlistant country.

The summit of the small island is composed of a bighty crystalline basatt; lower down I lound a hard stratitied slaty sandstone, while on the beach are hage blocks of lava, and scattered masses of white coralline limestone. The larger island has coral rock to a height of three or four hundred feet, while ahove is lavit and hasalt. It seems probable, therefore, that this little group of tour islands is the fragment of a larger district which was purhaps once connected with Ceram, but which was soparated and hroken up by the same forces which formed the voleanie roue. When I visited the larerer island on another oceasion, I saw a considerable tract covered with large forest trees, dead, but still standing. This was a record of the last great earthquake ouly two years ago, when the sea broke in over this part of the island and so flooded it as to Hestroy the vegetation on all the low lands. Almost every year there is an earthquake here, and at intervals of a few years very severe ones, which throw down houses and carry ships out of the harbour bodily into the streets.

Notwithstanding the losses ineurred by these terrific visitations, and the small size and isolated position of these little islands, they have been and still are of considerable value to the Dutch Government, as the chief nutmeg-garden in the world. Almost the whole surface is planted with nutmegs, grown under the shade of lolty

Kanary trees (Kamarium commune). The light volcanic soil, the shade, and the excessive moisture of these islands, where it rains more or less every montly in the year, seen exactly to suit the nutmer-tree, which requires no manure and scarely any attention. All the year round llowers and ripe fruit are to be found, and none of those diseases occur which under a forced and unnatural system of cultivation have ruined the nutneg planters of Singapore and lenang.

Few cultivated plants are more beautiful than nutmungtrees. They are handsomely shaped and glossy-leaved, growing to the height of twenty or thirty feet, and hearing mmall yellowish flowers. The fruit is the size and colour of a peach, but rather oval. It is of a tough fleslyy consistence, but when ripe splits open, and shows the darkbrown nut within, covered with the erimson mace, and is then a most beatiful olject. Within the thin hard shell of the nut is the seed, which is the nutmeg of commerce. The nuts are eaten by the large pigeons of Banda, which digest the mace but cast up the mut with its seed uninjured.
'lise nutmeg trade las hitherto been a strict monopoly of the Dutch Government; but since leaving the country I believe that this monopoly has been partially or wholly discontimued, a proceeding which appears exceedingly in judicious and quite unnecessary. There are cases in which monopolies are perfectly justifiable, and I helieve this to be one of them. A small country like Holland, cannot allord to keep distant and expensive colonies at a loss; and having possession of a very small island where a valuable product, not a wecessery of life, ean be obtained at little cost, it is almost the duty of the state to monopolise it. No injury is done thereby to any one, but a great benefit is conferred on the whole population of Holland and its dependencies, since the produce of the state monopolies saves them from the weight of a heavy taxation. Had the Government not kept the nutmeg trade of Banda in its own hands, it is probable that the whole of the islands would long ago have become the property of one or more large eapitalists. The monopoly would have been almost the same, since no known spot on the globe
can produce nutmegs so cheaply as Banda, but the profits of the monopoly would have gone to a few indiviluals instead of to the nation. As an illustration of how in state monopoly may become a state duty, let us suppose that no gold existed in Australia, but that it had been foum in inmense quantities by one of our ships in some small and barren island. In this case it would plainly become the duty of the state to keep and work the mines fin the public benefit, since by doing so, the gain would be tairly divided anong the whole population by decrease of taxation; whereas by leaving it open to free trade while merely keeping the government of the island, we should certainly produce enormons evils during the first struggle for the preeious metal, and should ultimately subside into the monopoly of some wealthy individual or great company, whose enormous revenue would not equally benefit the community. The nutmegs of Banda and the tin of Banea are to some extent parallel cases to this supposititious one, and I believe the Dutch Government will act most unwisely if they give up their monopoly.

Even the destruction of the nutmeg and clove trees in many islands, in order to restrict their cultivation to one or two where the monopoly conld be easily gutarded, usually made the theme of so much virtuous indiguation against the Dutch, may be defended on similar principles, and is certainly not nearly so bad as many monopolies we ourselves have till very recently maintained. Nutmegs aud cloves are not necessaries of life; they are not even used as spices by the natives of the Moluccas, and no one was materially or permanently injured by the destruction of the trees, since there are a hundred other products that can be grown in the same islands, equally valuable and far more beneficial in a social point of view. It is a case exactly parallel to our prohibition of the growth of tolneco in England, for fiscal purposes, and is, morally and ceomonically, neither better nor worse. The salt momopoly which we so long maintained in India was much worse. As lomg as we keep up a system of excise and customs on artides of chaly use, whick requires an claborate armat of oflicers and constguarls to curry into effact, and which ereatwa is number of purely lecral crimes, it is the leight of atswatity
for us to alfect indiguation at the conduct of the Ihutch. whor carries out a much more justitinble. less lurtful, and more protable system in their Eastern possessions. I drabengr ohjectors to point out any physical or moral evils that have actually resulted from the atton of the Dutch Government in this matter; whereas such evils are the almitten resalts of every one of our monopolies and restrictions. The conditions of the two experiments are totally different. The true "political economy" of a higher, when governing a lower race, has never yet been worked out. The applientiom of our "political econony" to such cases invariably results in the extinction or degradation of the lown tace: whonce we may consider it proballe that one of the necessary conditions of its truth is, the approximate: montal and social unity of the society in which it is applied. I shall mgan refer to this subject in my chapter on 'Ternate, one of the most celebrated of the old spiceislands.

The natives of Bumla are very much mixed, and it is pobnble that at least three-fonths of the popnlation are monurels, in various degrees of Malay, Papuan, Arab, bortusnese, and Duteh. The first two form the basis of the lamer protion, atml the dark skins, pronomed features, and more or less frizzly hair of the l'apuans preponderates. There seems little doubt that the aborigines of Banda were Papuans, and a portion of them still exists in the Kd ishands; where they emigrated when the Portugnese first took possession of their mative island. It is such perple is these that are olten looked upon as transitional forms between two very distinct mees, like the Malays and l'apuns, whereas they are only examples of intermixture.

The animal productions of Banda, though very few, are interesting. The islands have perhaps no truly indigenons Manmala but bats. The deer of the Noluccas and the ] ig hare probably been introduced. A species of Cuscus or Eastem opossum is also found at Banda, and this may be truly indigenous in the sense of not having been introduced by man. Of birds, during my three visits of one or two lays each, I collected eight kinds, and tite Duteh oflectors have added a fow others. The most
remarkable is a fine and very handsome fruit-pigeon, Carpophaga concinua, which feeds upon the nutmegs, or ather on the mace, and whose loud booming note is to be continually heard. This bird is found in the Ké and Matabello islands as well as Banda, but not in Ceram or any of the larger islands, which are inhabited by allied but very distinct species. A beantiful small fruit-dove, P'ilonopus diadematus, is also peculiar to Banda.

## CHAPTER XX.

## AMBUYNA.

(Deoemben 1857, остовER 1859, febrelry 1800.)
TWENTY hours from Panda brought us to Amboyna, the capital of the Molncers, and one of the oldest European settlements in the East. The island cousists of two peninsulas, so nearly divided by inlets of the sea, as to leave only a sandy isthmus about a mile wide near their eastern extremity. The western inlet is several miles long and forms a tine harbour, on the southern side of which is situated the town of Amboyna. I had a letter of introduction to Dr. Mohnike, the chicf medical officer of the Moluceas, a German and a naturalist. I found that he could write and read English, but conld not speak it, being like myself a bad linguist ; so we had to use French as a medium of communication. He kindly offered me a room during my stay in Amboyma, and introduced me to his junior, Dr: Doleschall, a Hungarian and also an entomologist. He was an intelligent and most amiable young man, but I was shocked to find that he was dying of consumption, though still able to perforn the duties of his office. In the evening my host took me to the residence of the Governor, Mr. Goldmann, who received me in a most kind and cordial manner, and offered me every assistance. The town of Amboyna consists of a few U 2

business streets, and a mumber of roads set out at right angles to each other, bordered by hedges of flowering shrubs, and enclosing combtry houses and huts enbosomed in palms and fruit trees. Hills and mountains form the background in almost every direction, and there are few places more enjoyable for a morning or evening stroll, than these sandy roads and shaty lanes in the suburbs of the ancient city of Amboyna.

There are no active volcanoes in the island, nor is it now subject to frequent earthquakes, although very severe ones have occurred and may be expected again. Mr. William Fumell, 14 his voyage with Dampier to the South Seas in 1705, says: "Whilst we were here, (at Amboyna) we had a great earthquake, which continued two days, in which time it did a great deal of mischicf ; for the ground burst open in many places, and swallowed up several houses and whole families. Several of the people were dug out again, but most of them dead, and many had their legs or arms broken by the tall of the houses. The castle walls were rent asunder in several phaces, and we thought that it and all the houses would have fallen down. The ground where we were swelled like a wave in the sea, hut near us we had no hurt done." There are also mumerous records of eluptions of a volcano on the west side of the island. In 1674 an eruption destroyed a village. In 1694 there was another eruption. In 1797 much vapour and lieat was emitted. Other eruptions oceured in 1816 and 1820 , and in 1824 a new crater is said to have been formed. Yet so capricious is the action of these subtermacan fires, that since the last-mamed epoch all eruptive symptoms have so completely ceased, that 1 was assured by many of the wost intelligent European inlabitants of Amboyna, that they had never heard of any such thing as a volcano on the island.

During the few days that elapsed before I could make arrangements to visit the interior, I enjoyed myself much in the society of the two doctors, both amiable and welleducated men, and both enthusiastic entomologists, though obliged to increase their collections almost entirely by means of native collectors. Dr. Doleschall studied chiefly the flies and spiders, but also collected buttertlies and
moths, and in his hoxes I saw gram specimens of the emerald Ornithoptera priamus and the azure lapilio ulysses, with many more of the superb butterilies of this rich island. Dr. Mohnike confined himelf chiedy to the beetles, and had formed a magnificent collection during many years' residence in Java, Sumatra, Borneo, Japan, and Amboyna. The Japanese collection was especially intresting, containing hoth the fine Carabi of northern combtries and the gorgeous Buprestide and Longieoms of the tropies. The doctor made the voyage to Jedhlo by land from Nagasaki, and is well aequanted with the character, maners, and customs of the people of Japan, and with the geology, physical features, and natural history of the country. He showed me collections of chenp woodeuts printed in colours, which are sold at less than a farthing each, and comprise an endless variety of sketehes of Japanese scenery and manners. Thourla ride, they are very characteristic, and often exhibit tonches of great humour. He also possesses a large collection of coloured sketches of the plants of Japran, made by a Japanese lady, which are the most masterly things I lave ever seen. Every stem, twig, and leaf is produced hy single touches of the brush, the character and perspective of very complicated plants being admirally given, and the articulations of stem and leaves shown in a most scientific manner.

Having made arrangements to stay for three weeks at a small hut, on a newly cleared plantation in the interior of the northern half of the island, I with some difliculty obtained a boat and men to take me aeross the water; for the Amboynese are drealfully lazy. Passing up, the harbour, in appearance like a fine river, the clearness of the water allorled me one of the most astonishing and beautiful sights I have ever beheld. The bottom was absolutely hidden by a continuous series of corals, sponges, aetinise, and wher marine productions, of magnificent dimensions, varied forms, and brilliant colours. The depth varied from about twenty to fifty feet, and the bottom was very uneven, rocks and chasms and little hills and valleys, offering a varicty of stations for the growth of these animal forests. In and out among them, moved numbers of blue
and red and yellow fishes, spotted and banded and striped in the most striking manner, while great orange or rosy transparent medusee iloated along near the surface. It was a sight to gaze at for hours, and no description can do justice to its surpassing beanty and interest. For nome, the reality exceeded the most glowing accounts I had ever real of the wonders of a coral sea. There is perhaps no spot in the world richer in marine productions, corals, shells and fishes, than the harbour of Amboyna.

From the north side of the harbour, a good hroad path passes through swam? clearing and forest, over hill and valley, to the farther side of the island; the coralline rock constantly protruling through the deep rell earth which fills all the hollows, and is more or less spread over the plains and hill-sides. The forest regetation is here of the most luxuriant chamater; ferns and palins ahound, and the elimbing rattans were more abundant than I had ever seen them, forming tangled festoms oxer ahnost every large forest tree. The cottare I was to ocempy was situated in a large clearing of about a hundred acres, part of which was already planted with young cacao-trees and plantains to shade them, while the rest was covered with doad and half-hurnt forest trees; and on one sule there was a tract where the trees had been recunty felled and were not yet burut. The path by which 1 ham arriwn continued along one side of this clearing, and then again entering the virgin forest passed over hill and dale to the northern side of the island.

My abode was merely a little thatched hut, consisting of an open verandah in front and a small dark slecepintroon behind. It was raised almont five feet from the ground, and was reached by rude steps to the centre of the verandah. The walls and floor were of bambur, and it contained a table, two lamboo chairs, and a coteh. Here I soon made myself confortable, and set to work hunting for insects anong the more recently felled timber, which swarmed with tine Curculionide, Longicorns, and Buprestide, most of them remarkable firs their elegant forms or brilliant colours, and almost all entively new to me. Only the entonolonist can apprecinte the delight with which I hunted about for hours in the
hot sunshine, among the branches and twigs and bark of the fillen trees, every few minutes securing insects which were at that time almost all rare or new to European collections.

In the shady forest paths were many fine butterflies, most conspleuous anong which was the shining blue Papilio ulysses, one of the princes of the tribe. Though at that time so rare in Europe, I found it absolutely common in Amboyna, though not easy to obtain in fine condition, a large number of the specimens being found when captured to have the wings torn or broken. It flies with a rather weak undulating motion, and from its large size, its tailed wings and brilliant colour, is one of the most tropicallooking insects the naturalist can gaze upon.

There is a remarkable contrast between the beetles of Amboyna and those of Macassar, the latter genemally small and obseure, the former large and brilliant. On the whole, the insects here most resemble those of the Aru islands, but they are almost always of distinct species, and when tiny are most neirly allied to each other the species of Amboyna are of larger size and more brilliant colours, so that one might be led to conclude that, in passing east and west into a less favourable soil and climate, they had degenerated into less striking forms.

Ol an evening I genemaly sat rearling in the veradah, ranly to capture any insects that were attracted to the lipht. One night about nine oblock, I leard a curious noise and rustling orerhend, as il some heavy animal were chawling slowly wer the thateh. The noise soon ceased, and I thought no more about it and went to bed soon atterwads. The next afternoon just before dinner, being rather tired with my day's work, I was lying on the couch with a book in my hand, when gazing upwards I siw a large mass of something overhead which I had not noticed hefore. Looking more carefully I could see yellow and hack marks, and thought it must be a tortoise-shell $1^{\text {mot }}$ up there out of the way between the ridge-pole and the roof. Continuing to gaze, it suddenly resolved itself into a large suake, compactly coiled up in a kind of knot; tud I could detect his liead and his bright eyes in the very centre of the folds. The noise of the evening before

was now explained. A python hat elimbed up ne of the posts of the house, and had made his way under the thatch within a yard of my head, and taken up a comfortable position in the roof-and I had slept soundly all night directly under him.

I called to my two boys who were skinning hirds below and said, "Here's a big snake in the root";" but as soon as I had shown it to them they rushed ont of the louse and begged me to come out directly. Finding they were too much afraid to do anything, we called some of the labourers in the plantation, and soon had half a dozen mea in consultation outside. One of these, a native of Bouru, where there are a great many smakes, said he would get him out, and proceeded to work in a businesslike manner. He made a strong noose of rattan, aud with a long pole in the other hand poked at the snake, who then began slowly to uncoil itself. He then managed to slip the noose over its heal, and getting it well on to the body, dragged the animal down. There was a great scufle as the snake coiled round the chairs and posts to resist his enemy, but at leugth the man caught hold of its tail, rushed ont of the house (rumning so quick that the creature seemed quite confonmied), and tried to strike its head against a tree. He nissed however, and let go, and the snake got under a dead trmak cluse by: It was again poked out, and again the Houru man canglit hold of its tail, and ruming away quickly dashed its head with a swing against a tree, and it was then easily killed with a hatchet. It was about twelve feet lons and very thick, capable of doing much misehitel and of swallowing a dog or a child.

I did not get a great many birds here. The most remarkable were the fine crimson lory, lios rulara-it hrushtongued parroquet of a vivid erimson colonr, which was very abundant. Large flocks of them came about the plantation, and formed a magnificent object when they settled down upon some flowering tree, on the nective of which lories feed. I also obtained one or two specimens of the fine racquet-tailed kinglisher of Amboyna, Tanysiptera mais, one of the most singular and beautiful of that beatiful family. These birds differ from all other king-
fishers (which have usually short tails) by having the two midthe tail-feathers immensely lengthened amd very narowly webbed, but terminated by a spom shaped enlargement, as in the motmots and some of the lumming-birds. They belong to that division of the family termed kinghonters, living chiefly on insects and small land-molluses, which they dart down upon and pick up from the ground, just as a kingfisher picks a fish out of the water. They are contined to a very limited area, comprising the Molnecas, New Guinea, and Northern Australin About ten species of these birds are now known, all much resembling each other, but yet sufficiently distinguishable in every locality. The Amboynese species, of which a very accurate representation is here given, is one of the largest and handsomest. It is full seventeen inches long to the tips of the tail-feathers; the bill is coral red, the under-surface pure white, the back and wings deep purile while the shoulters, hend and mape, and some spots om the upper part of the bask amh wings, are pure

azure bhe. The tail is white, with the feathers narrowly blue-ellyed, but the narrow part of the long feathers is rich blue. This was an entirely new species, and has been well named after an ocean golliess, by Mr. G. R. Gray.

On Christmas eve I returned to Amboyna, where I stayed about ten days with my kind friend Dr. Mohnike. Considering that 1 hat been iway only twenty days, amt that on five or six of those I was prevented doing anything by wet weather and slight attacks of fever, I haid made a very nice collection of inseets, comprising a much later proportion of large and brilliant species than I hail ever before obtained in so short a time. Of the beatiful metallic Buprestike I hal about a dozen handsome species, yet in the ductor's collection I observed four or five more very fine ones, so that Amboyna is unusually rich in this elegant group.

During my stay here I had a good opportunity of seeing how Furopeans live in the Dutch colonies, where they have adopted customs far more in accorlance with the climate than we have done in our tropical possessions. Alunst all lousiness is transacted in the morning betwren the hours of seven and twelve, the afternoon being given ${ }^{n} \mathrm{p}$ to repose, and the evening to visiting. When in the house during the heat of the day, and even at dimner, they use a loose entton dress, only putting on a suit of thin Emropen-made clothes, for out of doots and evening wear. They often walk nbout after sunset bareheaded, reserving the black hat for visits of ceremony. Life is thus made far more agreable, and the fatigue and discomfort incident to the climate greatly diminished. Christmas day is not made much of, but on New Year's day official and complimentary visits are paid, and about sunset we went to the Governor's, where a large party of ladies and gentlenen were assembled. Tea and coflee were handed round, as is almost universal during a visit, as well as cigars, for on no occasion is smoking prohilited in Dutch colonies, cigars being generally lighted before the cloth is withdrawn at dimer, even though half the company are ladies. I here saw for the first time the rare black lory from New Guinea, Chaleopsitta atra. The plumage is rather glossy, and slightly tinged with
vellowish and purple, the bill and feet being entirely black

The native Amboynese who reside in the city are a strange half-civilized half-savage lazy people, who seem to be a mixture of at least three races, Portuguese, Malay, and Papuan or Ceramese, with an occasional cross of Chincse or Dutch. The Portuguese element decidedly predominates in the old Christian population, as indicated by features, habits, and the retention of many Portuguese words in the Malay, which is now their language. They have a peculiar style of dress which they wear amoug themselves, a close-fitting white shirt with black trousers, and at lack frock or upper shirt. The women seem to prefer a dress entirely black. On festivals and holy days every man wears the swallow-tail coat, chimey$3^{\text {wit }}$ hat, and their accompaniments, displaying all the absurdity of our European fashionable dress. Though now lrotestants, they preserve at feasts and weddings the processions and music of the Catholic Church, curiously mixed up with the gongs and dances of the aborimimes of the country. Their language has still much more Portuguese than Dutch in it, although they have been in close communication with the latter nation for more than two lundred and filty years; even many names of birds, trees and other natural objects, as well as many domestic terms, being phanly l'ortuguese. ${ }^{1}$ This prople sems to have had a marvellous power of colonization, and a capacity for impressing their national chameteristics on every country they eonuuered, or in which they elfected a merely temporary settlement. In a suburb of Amboyna there is a vilhuse of ahoriginal Malays who are Mahometans, and who speak a peculiar language allied to those of Ceram, as well as Malay. They are chielly fishermen, and are said to he both more industrious and more honest than the mative Christians.

[^5]I went on Sunday, by invitation, to see a collection of shells and fish made by a gentleman of Amboyna. The fishes are perhaps unrivalled for variety and beaty by those of any one spot on the earth. The celebrated Dutch ichthyologist, Dr. Bleeker, has given a catalogue of seven hundred and eighty species found at Amboyna, a number almost equal to those of all the seas aud rivers of Europe. A large proportion of them are of the most brilliant colours, being marked with bands and spots of the purest yellows, reds, and blues; while their forms present all that strange and endless variety so characteristic of the inlabitants of the ocean. The shells are also very numerous, and comprise a number of the finest species in the world. The Mactras and Ostreas in particular struck me by the varicty and beanty of their colours. Shells have long been an object of traffic in Amboyna; many of the natives get their living by collecting and cleaning them, and almost every visitor takes away a small collection. The result is that many of the commoner sorts have lost all value in the eyes of the amateur, numbers of the handsome but very common cones, cowries, and olives sold in the streets of London for a penny ench, being natives of the distant isle of Amboyna, where they cannot be bonght so cheaply. The fishes in the collection were all well preserved in clear spirit in hondreds of glass jars, and the sliells were arranged in large shallow pith boxes lined with paper, every specimen being fastened down with thread. I roughly estimated that there were nearly a thousand different kinds of shells, and perhaps ten thousand specimens, while the collection of Amboyna fishes was nearly perfect.

On the 4th of January I left Amboyna for Ternate; but two years later, in October 1859, I again visited it after my residence in Menado, and stayed a month in the town in a small house which I hired for the sake of assorting and packing up a large and varied collection which I had brought with me from North Celebes, Ternate, and Gilolo. I was obliged to do this because the mail-steanmer would have come the following month by way of Amboyna to Ternate, and I should have been delayed two months before I could have reached the former ${ }^{\text {blace. I I }}$ Inen paid
my first visit to Comm, aml on setarnimg to prepare tot ney sermat more complete exploration of that islame, I stayed (much aganst ny will) two montles at laso, on the isthmus which comects the two prortions of the ishand of Amboyma. This village is situated on the eastem side. of the isthams, on samly ground, with a very pleasant view wer the sea to the island of Hanka. On the Amboyna side of the isthmos there is a small river which has been continued by a shallow canal to within thinty yards of high-water mark on the other side. Aeross this small space, which is sandy and but slightly elevated, all small boats and prans can be easily draged, and all the smaller trathe from Ceram and the islands of Sapana and Hanka, passes through laso. The canal is not continued quite through, merely heeanse every spring-tide would thow up just such a sand-bank as now exists.

I had been informed that the fine butterfly Ornithopitera priamus was plentiful here, as well as the racquet-tailed kingtisher and the ring-necked lory. I fomm, however, that 1 had missed the time for the former; and bivels of all kimls wore very scarce, although I obtained a few goond mes, incluting one or two of the above-mentioned rarities. I was mach plased to get here the fine loneramed chater, Buchirus longimanus. This extmordinary insect is ravely or never captured except when it comes to drink the sap of the sugar palms, where it is found by the natives when they go early in the morning to take away the bamboos which have been filled during the uight. For some time one or two were brought me every day, generally aliva. They are sluggish insects, anil pull themselvos haily along by means of their imntense forc-legs. A furne of this and other Molncean beetles is given in the 27 th chapter of this work.

I was kept at laso by an inflammatory eruption, brought on by the constant attacks of small acari like harvestbugs, for which the forests of Cormm are famons, and also by the want of nourishing food while in that island. At one time I was covered with severe boils. I hatd them on ny eye, cheek, armpits, cllows, back, thighs, linees, and mukles, so that I was unable to sit or walk, and had great dillienlty in fiuding a side to lic upon wilhont pain. These
entimued for somur week, fresh ones coming ont as fast as others qut well; but grod living and sea laths ultimately cured them.

About the ent of Jamarg Charles Allen, who had been my assistant in Matacea and Burneo, aqain joinad me on agreement for three years; and as soon ins I got tolerably well, we had plenty to do haying in stores and making armagements for om ensuing campain. One greatest difficulty was in obtaining men, but at last we succeeded in getting two each. An Amboyna Christian mamed Theodonts Matakena, who hat been some time with me and had learnt to skin birds very well, agreed to go with Allen, as well as a very quiet and industrious lad named Comelins, whom I had hrought from Menado. I had two Amboynese, named Petrus Rehatta, and Mesach Matakena; the latter of whom hat two brothers, named resqectively Shathach and Abednego, in aceordance with the ustal custom among these people of giving only Scripture names to their children.

During the time I resided in this place I enjoyed a luxury I have never met with either before or since-the true bread-fruit. A good deal of it has been planted about here ant in the survonting villages, and almost every day we land opportunities of purchasiug some, as all the boats going to Amboyna were unlouded just apposite my door to be draged across the isthmos. Though it grows in several other parts of the Archipelago, it is nowbere abundant, and the season for it only lasts a short time. It is baked entire in the lint embers, and the inside scooped out with a spoon. I compared it to lorkshire pudding; Charles Allen said it was like mashed potatoes and milk. It is generally about the size of a melon, a little fibrons towards the centre, but evergwhere else yuite smooth and puddingy, something in consistence between yeast-dumplings and batter-pudding. We sometimes made curry or stew of it, or fried it in slices; hut it is no way so rood as simply baked. It may be eaten sweet or savory. With meat and grayy it is a vegetable superior to any I know, either in tenperate or tropical countries. With sugar, milk, butter, or treacle, it is a delicious pudding, having a very slight and delicate
but characteristic flavour, which, like that of good bread and potatoes, one never gets tired of. The reason why it is comparatively scarce is, that it is a fruit of which the seeds are entirely aborted by cultivation, aud the tree can therefore only be propagated by cuttings. The seed-bearing variety is common all over the tropies, and though the seeds are very grood eating, resembling chestnuts, the fruit is quite worthless as a vegetable. Now that steam and Ward's cases render the transport of young plants so easy, it is much to be wished that the best varieties of this unequalled vegetable should be introduced into our West India islands, and largely propagated there. As the fruit will keep some time after being gathered, we might then be able to obtain this tropical luxury in Covent Garden Market.

Although the few months I at varions times spent in Amboyna were not altogether very profitable to me in the way of collections, yet it will always remain as a bright spot in the review of my Eastern travels, since it was there that I first mate the acquaintance of those glowious birds and insects, which reader the Molnceas classic ground in the eyes of the naturalist, and characterise its fauna as one of the most remarkable and beautiful upon the globe. On the 20th of February I finally quitted Amboyna for Ceram and Waigiou, leaving Charles Allen to go by a Govermuent boat to Walai on the north coast of Ceram. and thence to the unexplored island of Mysol.

## CHAPTER XXI.

IIIE MOLUCCAS-TERNATE

0N the morning of the Sth of January, 1858, I arrived at Ternate, the fourth of a row of fine conical volcanie islands which skirt the west coast of the large and almost maknown istand of Gilolo. The largest and most perfectly conical mountain is Tidme, which is over four thousand
feet high-Temate being very nearly the same height, but with a more rounded and irregular summit. The town of Ternate is concealed from view till we enter between the two islants, when it is discovered stretching along the shore at the very lase of the mountain. Its situation is fine, ams there are graml views on every side. Close opposite is the rugged promontory and beautiful volcanic cone of Tidore; to the east is the long monntanous const of (iilolo, temnated towards the north by a group of three lofty volemis peaks, while inmediately behad the town rises the lage motontain, sloping easily at first and covered with thick groves of truit trees, hat soon becoming steeper, and furrowed with deepgrallies. Almost to the summit, whence issue perpetually faint wreaths of smoke, it is clothed with vegetation, amd looks calm and beautilul, althongh beneath are hidden fires which occasionally burst lorth in lava-streams, but more frequently make their existence known by the cadirquakes which have many times devastated the town.

I brought letters of introduction to Mr. Duivenboden, a native of Ternate, of an ancient Dutch family, but who was, educated in Eingland, and speaks our language perfectly. He was a very rich man, owned half the town, possessed many ships, and above a hundred slaves. He was moreover, well ednated, and fond of literature and science-a phenomenon in these regions. Ife was gonerally known as the king of Ternate, from his large property and great influence with the native lajahs and their subjects. Through his assistance I obtained a house, rather ruinous, but well mupted to my purpose, being close to the town, yet with a free outlet to the comntry and the mountain. A tew neelful repairs were soon made, some lamboo furniture and other necessaries obtained, and atter a visit to the Resident and Police Mayistrate I found myself an inhabitant of the carthquake-tortured island of Pernate, and able to look about me and lay down the plan of my campaign for the ensumg year. I retained this house for three years, as I found it very conventent to have a place to return to alter my voyages to the various islands of the Moluccas and New Gumen, where I could pack my collections, recruit my health, and make preparations
for future journeys. To avoid repetitions, I will in this chapter combine what notes I have about Ternate.
$\Lambda$ description of my house (the plan of which is here shown) will enable the reader to understand a very conmon mode of building in these islauds. There is of course only one floor. The walls are of stone up to three feet high; on this are strong squared posts supporting the : of, everywhere except in the verandah filled in with the

TOAD.
leaf-stems of the sngo-palm, fitted neatly in wooden framing. The floor is of stucco, and the ceilings are like the walls. The house is forty feet square, consists of four rooms, a hall, and two verandahs, and is surrounded by a widderness of fruit trees. A deep well supplied me with pure cold water, a great luxury in this climate. Five minutes' walk down the road lromght me to the market and the beach, while in the opposite direction there were no more European houses between me and the mountain. In this house I spent many happy days. Returning to it after a three or four months' absence in some uncivilized
region, I enjoyed the unwonted luxuries of milk and fresh mread, and regular supplies of tish and eggs, meat and vegetables, which were often sorely needed to restore my health and energy. I had ample space and convenience for unpacking, sorting, and arranging my treasares, and I haul delightful walks in the suburbs of the town, or up the lower slopes of the mountain, when I desired a little exercise, or had time for collecting.

The lower part of the mountain, behind the town of Ternate, is alnost entirely covered with a forest of fruit trees, and during the season lundreds of men and women, hoys and girls, go up every day to bring down the ripe fruit. Durians and Mangoes, two of the very finest tropical fruits, are in greater abondance at Ternate than I have ever seen them, and some of the latter are of a quality not inferior to any in the world. Lansats and Mangīstans are also abundant, but these do not ripen till a little later. Above the fruit trees there is a belt of clearings and cultivated grounds, which creep up the mountain to a height of between two and three thousand feet, above which is virgin forest, reaching nearly to the summit, which ou the side next the town is covered with a high reedy grass. On the further side it is more elevated, of a bare and desolate aspect, with a slight depression marking the position of the erater. From this part descends a black scoriaceous tract, very rugged, and covered with a scanty veretation of scattered bushes as far down as the sea. This is the lava of the great eruption near a century ago, and is called by the natives "batu-angas" (burnt rock).

Just below my house is the fort, built by the Portuguese, below which is an open space to the beach, and beyond this the native town extends for about a mile to the north-east. About the centre of it is the palace of the Sultan, now a large untidy, half-ruinous building of stone. This chief is pensioned by the Dutch Goverument, but retains the sovereignty over the native population of the island, and of the northern part of Gilolo. The sultans of Ternate and Tidore were once celebrated through the East for their power and regal magnificence. When Drake visited Ternate in 1579, the Portuguese had heen driven out of the island, although they still had a settlement at

Thidore. He gives a glowing account of the Sultan: "The King lad at very rich catiopy with embossings of gold borne over him, am was guarded with twelve laness. From the waist to the gronnd was all cloth of gold, and that very rich; in the attire of his head were tinely wreathed in , diverse rings of plaited goled, of an inch on more in breath, which made a fair and princely show, somewhat respmbling a crown in form; whont his neck he had a chain of pertect gold, the links very great and one fold double; on his lelt hand was a dianond, int emerald, a ruhy, and a turky; on lis right hand in one ring a hig tud pertect turky, and in another ring many dianonds of a sualler size."

All this ghither of latharic grold was the protuce of the spice trade, of which the Sultans liept the monopoly, and by which they lreatme wealthy. Ternate, with the small islands in a lime sumb of it, as far as Batehian, constitute the ancient Moluceas, the mative country of the clove, as well as the only part in which it was cultivated. Nutmegs and mate wre procured from the natives of Now Gainea and the adjacent islands, where they grew wild and the profits on spige cumbes were so enomons, that the Furopean twaters were glad to give gold and jewels, und the finest mandactures of larope or of India, in exchange. When the Duteh established their inthence in these seas, and relieved the mative princes from their Portuguese oppressors, they saw that the easiest way to repay themsclves would be to get this spice trade intu, their own hamds. For this purpose they atopted the wise principle of concentrating the culture of these valuable products in thase spots only of which they could have comphto control. To do this dreetually it was necessary to abolish the culture and trade in all other phaces, which they succeald in doing by treaty with the native rulers. These ngred to have all the spiee trees in their possessions destroyeal. They gave up large though fluctuating revenus, but they gained in return a fixed subsidy, freealom from the constant attacks and harsh oppressions of the lortuguse, ant a continuance of their regal power and exclusive anthority over their own subjects, which is maintained in all the slands except Ternate to this day.

It is no doubt supposed by most Englishmen, who lave been accustomed to look upon this act of the Dutch with vague horror, as sometling utterly upprincipled and barbarous, that the native population suffered grievously by this destruction of such valualle propurty. But it is certain that this was not the case. The Sultans kept this lucrative trade entirely in their own hands as a rigid monopoly, and they would take care not to give their subjrets more than would amount to their usual wages, while they would surely exact as large a quantity of spice as they could possibly obtain. Drake and other early voyagens always seen to have purchased their spice-cargoes from the Sultans ant lajalis, and not from the cultivators. Now the alsorption of so much laburur in the eultivation of this one product must necessarily have mised the price of food and other necessaries; and when it was alwlished, mare rice would he grown, more sago made, wore fish caught, and more tortoise-shell, rattan, gum-tammer, and other valuahle products of the seas and the forests would be obtained. I believe, therefore, that this alolition of the spice trade in the Moluceas was actually beneficial to the inhalitants, and that it was an out both wise in itself and morally and politically justifiable.

In the selection of the phaces in which to earry on the cultivation, the Dutel were not altogether fortunate or wise. Bama was chosen for nutmerg, and was eminently successful, since il continnes to this day to produce a large supply of this spice, and to yieh a considerable revenue. Anboyna was fixed upon for establishing the elove cultivation; but the soil and climate, although aprarently very similar to that of its native islands, is not favourable, and for some years the Government have actually been paying to the cultivators a higher rate than they ennld purchase rloves elsewhere, owing to a great fall in the price since the rate of payment was fixed for a tem of years ly the Dutch Government, and which rate is still most honourably paid.

In walking about the sulurbs of Termate, we find everywhere the ruins of massive stone and hrick buildings, gateways and arches, showing at once the superior wealth of the ancient town and the destructive effects of
eartliquakes. It was during my second stay in the town, after my return from New Guinea, that I first felt an earthquake. It was a very slight one, scarcely more than has been felt in this country, but occurring in a place that had been many times destroyed by them it was rather more exciting I had just awoke at gun-five ( $5 \mathrm{~A} . \mathrm{m}$.) when suddenly the thatch began to rustle and shake as if an army of cats were galloping over it, and immediately afterwards my bed shook too, so that for an instant I imagined myself back in New Gunea, in my fragile houst. which shook when an chd cock went to roost on the ridiget : but remembering that I was now on a solid earthem thoor, I said to myself, "Why, it's an earthouake," and lay still in the pleasing expectation of another slock; har none came, and this was the only earthquake I ever fols in Ternate.

The last great one was in February 1840, when almust every house in the place was destroyed. It began ahout midnight on the Chinese New Year's festival, at whir-l time every one stays up nearly all night feasting at the Chinamen's houses and seeing the processions. This privented any lives being lost, as every one ran oul ol doors at the first shock, which was not very severe. Tlue second, a few minutes alterwards, threw down a great many houses, and others, which continued all night and part of the next day, completed the devastation. The lin? of disturbance was very narrow, so that the native town a mile to the east scarcely suffered at all. The wave passed from north to south, through the islands of Tidore and Makian, and terminated in latehian, where it was not felt till four the following afternoon, thus taking no less than sixteen hours to travel a hundred miles, or about six miles an hour. It is singular that on this occasion there was no rushing up of the tide, or other commotion of the sea, as is usually the case during great earthquakes.

The people of Temate are of three well-marked races: the Ternate Malays, the Orang Sirani, and the Dutch. The first are an intrusive Malay race somewhat allied to the Macassar people, who settled in the country at a very early epoch, drove out the indigenes, who were no doubt the same as those of the adjacent mainland of Gilolo, and
established a monarchy. They perhaps obtained many of their wives from the natives, which will account for the extraordinary languaye they speak-in some respects closely allied to that of the natives of Gilolo, while it contains much that points to a Malayan origin. To most of these: people the Malay language is quite unintelligible, although such as are engaged in trade are obliged to acquire it. "Orang Sirani," or Nazarenes, is the name given by the Malays to the Christian descendants of the Portuguese, who sesemble those of Amboyna, and, like then, speak only Malay. There are also a number of Chinese merchants, many of them natives of the place, a few Arabs, and a number of half-breeds between all these races and native women. Besides these there are some Papuan slaves, and a few natives of other islands settled here, making up a motley and very puzzling population, till inquiry and observation have slown the distinet origin of its component parts.

Soon after my first arrival in Ternate I went to the island of Gilolo, accompanied by two sons of Mr. Duivenboden, and by a young Chinaman, a brother of my landlord, who lent us the boat aud crew. These latter were all slaves, mostly Papuans, and at starting I saw something of the relation of master and slave in this part of the world. The crew had been ordered to be ready at three in the morning, instead of which none appeared till five, we having all been kept waiting in the dark and cold for two hours. When at length they came they were scolded by their master, but only in a bantering manner, and laughed and joked with him in reply. Then, just as we were starting, one of the strongest men refused to go at ali, and his master lad to beg and persuade him to go, and only succeeded by assuring him that I would give him something; so with this promise, and knowiug that there would be plenty to eat and limin and little to do, the black gentleman was induced to favour us with his company and assistance. In three hours' rowing and sailing we reached our destination, Sedingole, where there is a house belonging to the Sultan of Tillore, who sometimes groes there hunting. It was a dirty ruinous shed, with no furniture but a few bamboo bedsteadis. On taking a walk into the
country, I saw at once that it was no place for me. For many miles extends a plaitu covered with coarse high grass, thickly dotted here and theres with trees, the forest country cnly commencing at the hills a good way in the interior. Such a place would produce few birds and no insects, and we theretore arranged to stay only two days, and then go on to Dodiuga, at the narrow central isthmus of Gilolo, whence my friends would return to lernate. We amused ourselves shooting parrots, lories, and pigeons, and trying to shoot deer, of which we saw plenty, but could not get one; and our erew went out fishing with a met, so we did not want for provisions. When the time came for us to contimue our journey, in fresh diflicalty presented itself, for our gentlenen slaves refused in in body to go with us, saying very determinedly that they wouk return to Teruate. So theif masters were obliged to submit, and I was left hehind to get to Dorlinga as I could. Luckily I succeeded in hiring it small boat, which took me there the same night, with my two men and my baggage.

Two or three years after this, and about the same length of time before I left the East, the Dutch emancipated all their slaves, paying their owners a small compensation. No ill results followed. Owing to the amicable relations which had always existed between them and their masters, due no doubt in jart to the Govermment having long nccorded them legal rights and protection against cruelty and ill-usage, many continued in the sane service, and after a little temporary difficulty in some cases, almost all returned to work either for their old or for new masters. The Govermment took the very proper step of paning every emancipated slave under the surveillance of the police-magistrate. They were obliged to show that they were working for a living, and had some honestlyaequired means of existence. All who could mit do so were placed upon public works at low wanes, and thus were kept from the temptation to peculation or other crimes, which the exclitement of newly-acquired freedom, and disinclination to lahour, might have led them into.

## CHAPTER XXII.

GILOLO.

(Manca and sempemben 1858.)

IMADE but few and comparatively shor bisits to this large and litle known island, but obtained a considerable knowledge of its natural history by senting first my boy Ali, and then my assistant, Charles Allen, who stayed two or three months each in the northem peninsala, and brought me baek lare collections of birds and insects. In this chapter I propese to give a sketch of the parts which I myself visited. My tirst stay was at Dodinga, situated at the head of a deep bay exactly opposite 'rernate, and a short distance up a little stream which penetrates a few miles inland. The village is a small one, and is completely shut in by low hills.

As soon as I arrived, 1 applied to the head man of the village for a house to live in, but all were oceupied, and there was much dificulty in finding one. In the meantime I unloaded my haggate on the beach and made sonte tea, and afterwards discosered a stnall hat which the owner was willing to vacate if I would pay him five guilders for a month's rent. As this was sonething less than the fee-simple value of the dwelling, I argred to give it him for the privilege of immediate occupation, only stipulating that he was to mak the roof water-tisht. This he agreed to do, and came every day to talk and hrok at ure; and when I cach time insisted upon his immediately mending the rout acooding to contrate all the answer I conll get was, "Sa nanti," (les, wait a little). However, when I threatened to deduct a quarter guilder from the rent for every day it was not done, and a guidery extra if any of my things were wetted, he conlescended to work for lialf an hotr, which did all that was absolntely necessary.

On the top of a bank, of absut a hundred feet ascent from the water, stands the very small but substantial fort erected
ly the Portuguese. Its batllements and turrets have long since been overthrown ly earthquakes, by which its massive structure has also been rent; but it cannot well be thrown down, being a solid mass of stonework, furming a platform about ten feet ligh, and perhaps forty feet square. It is approached by narrow steps under an archway, and is now surmonnted by a row of thatched hovels, in which live the small garrison, consisting of a Dutch corporal and four Javanese soldiers, the sole representatives of tha Netherlands Govermment in the island. The village is secupied entirely by Ternate men. The true indigenes of Gilolo, "Alfuros" as they are here called, live on the eastern coast, or in the interior of the northern peninsula. The distance across the isthmus at this phace is only two miles, and there is a good path, along which rice and sayo are brought from the eastern villages. The whole isthmes is very rugged, though not high, being a succession of little abrupt hills and valleys, with angular masses of limestone rock everywhere projecting, and often almost biocking up the pathway. Most of it is virgin forest, very luxuriant and picturesque, and at this time having abundunce of large searlet lxomas in flower, which made it exeeptionally gay. I got sone very nice inseds here, though, owing to illness most of the time, my collection was a small one; and my boy Ali shot me a pair of one of the most beautifind birds of the East, l'itta gigas, a large ground-thrush, whose plumage of velvety hack above is relieved ly a breast of pure white, shoulders of azure bhes, and belly of vivid crimson. It has very long and strony legs, and hops about with such activity in the dense taurfed forest, bristling will rocks, as to make it very difficult to shoot.

In September 1858, after my return from New Guinea, I went to stay some time at the village of Djilolo, situated in a bay on the northern peninsula. Here 1 obtained ia house through the kinduess of the Resident of Ternate, who sent orders to prepare one for me. The first walk into the unexplored forests of a new locality is a moment of intense interest to the naturalist, as it is almost sure to rumish him with something curious or hitherto unknown. The first thing I saw here was a flock of small parroquets, of which I shot a pair, and was pleased to find a most
beautiful little long-tailed bird, ornamented with green. red, and blue colours, and quite new to me. It was a variety of the Charmosyua placentis, one of the smallest and most elegant of the brush-tongued lories. My hunters soon shot me several other fine birds, and I myself fonnd a specimen of the rare and beatiful day-llying moth, Cocytia d'Urvillei.

The village of Djilolo was formerly the chief residence of the Sultans of Ternate, till about eighty years aro, when at the request of the Dutch they removed to their present abode. The place was then no doubt much more populous as is indicated by the wide extent of cleared land in the neighbourhood, now covered with coarse high grass, very disagreable to walk through, and utterly baren to the naturalist. A few days' exphoring showerl me that only some small patehes of forest remained for miles round, and the result was a scarcity of insects and a very limited variety of birds, which obliged me to change my locality. There was another village called Sahoe, to which there was a road of about twelve miles overland, and this had been recommended to me as a goml place for birds, and as possessing a large population both of Mahometans and Alfuros, which latter race I much wished to see. I set off one morning to examine this phace myself, expecting to pass through some extent of torest on my way. In this however I was much disappointed, as the whole road lies through grass and serubby thickets, and it was only after reaching the village of Salhoe that some high forest land was pereeived stretching towards the mountains to the north of it. About half-way we had to pass a deep river on a bamboo raft, which almost sunk beneath us. This stream was said to rise a long way ofl to the northward.

Although Sahoe did not at all appear what I expected, I determined to give it a trial, and a few days afterwards obtained a loat to carry my things by sea while I walked overland. A large house on the beach belonging to the Sultan was given me. It stood alone, and was quite open on every side, so that little privacy coukd be had, but as I only intended to stay a short time I made it do. A very few days dispelled all hopes I might have entertained of
making good collection: in this place. Nothing was to be found in every divection lat intermimable traets of reedy grass, eight or tor feet high, traversed by narrow paths, often almost inpassable. Here: and there were clumps of fruit trecs, pacles of low wood, and abumbabe of plautations and rice grounds, all of which are, in tropical regions, a very desert for the entnmologist. The virerin forest that I was in searel of, existed only on the summits and on the steep rocky siles of the munatitins a long way off, and in insecessible situations. Ju thw suhmels of the village 1 fonnd a fain momber of bees and wasps, and shme small lout intersting betles. Two or three new birds were obtained by my hunters, and by inessant inquintes and pomises I succedel in getting that matives to bring me some land shells, among whid was a very fine and fandsome one, Helix pyrostoma. I was, however, completely wasting my time here compared with what I minht be doing in at good locality, and after a work returned to Ternate, quite disappointed with my first attempts at collecting in Gilolo.

In the comntry round about Sahon, and in the interior, there is a large poutation of indicens, numbers of whom cane daily into the village, bringiner their jooduce for sale, while others were engaged as diboumers by the Chinese and Temate traters. A caroful examination convinced me that these prople are radically distinct from all the Matay races. Their stature and their teatures, as well as their disposition and habits, are almost the same as those of the ${ }^{2}$ lapuans; their lair is semi-Fapum-weither straight. smooth, and elussy, like all true Malays', nor so frizzly and woolly as the forfect lapman type, hat always erisp, waved, and hough, such as often cocurs anong the true litpuans, but never anong the Malays. Their colour alone is often exactly that of the Mahay, or even lighter: Of course there has been intormixture, and there occar neasionally individuals which it is difheult to classity; ut in most cuses the large, somewhat aquiline nose, with longated apex, the tall stature, the waved hair, the beardel face, and hary body, as well as the less reserved manuer and louder roice, unmistakeably proclaim the Papuan type. Here then I had discovered the exact boundary line
between the Malay and Papuan races, and at a spot where no other writer had expected it. I was very much pleased at this letermination, as it gave me a clue to one of the most difficult problems in Ethnolory, and enabled ne in many other places to separate the two races, and to unravel their intermixtures.

On my return from Waigiou in 1860, I stayed some days on the southern extremity of Gilolo but, beyond seeing something more of its structure and general character, obtainel very little additional information. It is only in the northern peninsula that there are any indigenes, the whole of the rest of the island, with Batchian and the other islands westward, being exclusively inhabited hy Malay tribes, allied to those of Ternate and Tidore. This wouk seem to indicate that the Alfuros were a comparatively recent immigration, and that they had come from the north or cast, perhaps from some of the islands of the Pacifie. It is otherwise difficult to understand how so many fertile districts should possess no true indigenes.

Gilolo, or Itahmabira as it is called by the Malays and Dutch, seems to have been recently nodified by upheaval and subsidence. In 1673 , a mountain is said to lave been upheaved at Gamokonom on the northern peninsula. All the parts that I have seen have either been volcanic or comallite, and along the coast there are fringing coral reefs very dangerous to mavigation. At the same time, the character of its matural history proves it to be a rather ancient land, since it possesses a number of animals peculiar to itself or common to the small islands around it, but almost always distinct from those of New Gninea on the east, of Ceram on the soutl, and of Celebes and the Sula islands on the west.

The island of Morty, close to the north eastern extremity of Gilolo, was visited by my assistant Charles Allen, as well as by Dr. Bernstein; and the collections obtained there present some curious differences from those of the main island. About fifty-six species of land-birds are known to inhabit this island, and of these a kingtisher (Tanysiptera doris), a honeysucker (Tropidorhynchus fuscicapillus), and a large crow-like starling (Iycocorox moro-
tensis), are quite distinct from allied species found in Gilolo. The island is coralline and sandy, and we must therefore believe it to have been separated from Gilolo at a somewhat remote epoch; while we learn from its natural history that an arm of the sea twenty-five miles wide serves to limit the range even of birds of considerable powers of tlight.

## CIIAPTER XXIII.

ternate to the kaióa islands and batcifian.
(OCTOBER 1858.)

0N returning to Ternate from Sahoe, I at once began making preparations for a journey to Butchian, an island which 1 had been constantly recommended to visit since I had arrived in this part of the Moluccas. After all was ready I found that I should have to hire a boat, as no opportunity of obtaining a passage presented itself. I accordingly went into the native town, and could only find two boats for hire, one much larger than I required, and the other far smaller than I wished. I chose the smaller one, chicfly because it would not cost me one-third as much as the larger one, and also because in a coasting voyage a small vessel can be more easily managed, and more readily got into a place of safety during violent gales, than a large one. I took with me my Bornean lad Ali, who was now very useful to me; Lahagi, a native of Ternate, a very good steady man, and a fair shooter, who had been witli me to New Guinea; Lahi, a native of Gilolo, who could speak Malay, as woolcutter and general assistant ; and Garo, a boy who was to act as cook. As the boat was so small that we had hardly room to stow ourselves away when all my stores were on board, I ouly Look one other man named Latchi, as pilot. He was a Papuan slave, a tall, strong black fellow, but very civil and careful. The boat I had hired from a Chinaman named Lau Keng Tong, for five guilders a month.

We started on the morning of October 9th, but lian not got a hundred yards from land, when a strong head wind sprung up, against which we could not row, so we erept along shore to below the town, and waited till the turn of the tide should enable us to cross over to the coast of Tidore. About three in the afternoon we got off, aud found that our boat sailed well, and would keep pretty close to the wind. We got on a good way before the wind fell and we had to take to our oars again. We landed onl a nice sandy beach to cook our suppers, just as the sun set behind the rugred volcanic hills, to the south of the great aone of Tidore, and soon after beheld the planet Venus shining in the twilight with the brilliancy of a new moon, and casting a very distinct shadow. We left again a little before seven, and as we got out from the shadow of the mountain I observed a bright light over one part of the ridge, and soon after, what seemed a fire of remarknble whiteness on the very summit of the hill. I called the attention of my men to it, and they too thought it merely a fire; but a few minutes afterwards, as we got farther off shore, the light rose clear up above the ridge of the hill, and some faint clouds clearing away from it, discovered the magnificent comet which was at the same time astonishing all Europe. The nacleus presented to the naked eye a distinct dise of brilliant white light, from which the tail rose at an angle of about $30^{\circ}$ or $35^{\circ}$ with the horizon, curving slightly downwards, and terminating in a broad brush of faint light, the curvature of whieh diminished till it was nearly straight at the end. The portion of the tail next the comet appeared three or four times as bright as the most luminous portion of the milky way, and what struck me as a singular feature was that its upper margin, from the nucleus to very near the extremity, was elearly and almost shaply defined, while the lower side gradually shaded off into obscurity. Directly it rose above the ridge of the hill, I said to my men, "Sce, it's not a fire, it's a lintang ber-ekor" (" tailedstar," the Malay idiom for a comet). "So it is," said they; and all declared that they had often heard tell of such, but had never seen one till now. I had no telescope with me, nor any instrument at hand, but I estimated the
length of the tail at about $20^{\circ}$, and the width, towards the extremity, about $4^{\circ}$ or $5^{\circ}$.

The whole of the next day we were obliged to stop near the village of Tidore, owing to a strong wind right in our teeth. The country was all cultivated, and I in vairs searched for any insects worth capturing. One of my men went out to shoot, but returned home without a single bird. At sunset, the wind having dropped, we quitted Tidore, and rethed the next ishand, Mareh, where we stayed till morning. The comet was again visible, but not nearly so brilliant, being [artly obscured by clouds, and dimmed ly the light of the new moon. We then rowed across to the island of Motir, which is so surrounded with coral-reefs that it is thangerous to appronch. These are perlectly flat, and are only covered at hinh water, ending in eragey vertical walls of coral in very deep water. When there is a little wind, it is dangerous to come near these rocks; but Juckily it was quite smooth, so we moored to their edge, while the men crateled over the reef to the land, to make a fire and cook our dinner-the boat haviog to accommodation for more than heating water for my morning and evening eollie. We then rowed along the edge of the reet to the end of the islaml, amd were glad to get a nice westerly breeze, which carried us orer the strait to the island of Makian, where we arrived about 8 P.m. The sky was quite clear, and though the moon shone brightly, the comet appared with quite as math splendour as when we first saw it,

The coasts of these small islands are very different according to their genlogical formation. The voleanoes, active or extinct, have steep black beaches of voleanie sant, or are fringed with rugged masses of lava and basalt. Coral is gemerally absent, occuring only in small patehes in quiet bays, and marely or never forming reefs. Termate, Tidore, and Makian belong to this class. Islands of volcanic origin, not themselves volcanoes, but which have been probably recently upraised, are generally more or less compltely surrounded by fringing reets of coral, and have beaches of shining white coral sand. Their coasts present voleanic conglomerates, basalt, and in some places a foundation of stratified rocks, with patches of upraised
coral. Mareh and Motir are of this character, the ontline of the latter giving it the appearance of having been a true voleans, and it is said by Forrest to have thrown out stones in 1778 . The next day (Oct. 12th), we coasted along the island of Makian, which consists of a single grand voleano. It was now quiescent, but alont two centuries ago (in 1646) there was a terrible eruption, which blew up the whole top of the momtain, leaving the truncated jagged summit and vast gloomy crater valley which at this time distinguished it. It was said to lave been as lofty as Thlore before this catastrople. ${ }^{1}$

I stayed some time at a place where I saw a new clearing on a very steep part of the mountain, ame ohtrined a few interesting insects. In the evening we went un to the extreme sonthern point, to be ready to pass across the fiftern-mile strait to the island of Kaién. At five the next morning we started, but the wind, which hat hitherto been westerly, now got to the south and southWest, and we hat to row almost all the way with a burning sun overhead. As we approached land a fine breeze sprang up, and we went along at a great pace; yet after an hour we were no nearer, and found we were in a violent current carrying us out to sea. At length we overcame it, and got on shore just as the sun set, having been exactly thirteen hours coming fifteen miles. We landed 011 a leach of lard coralline rock, with marged cliffs of the same, resembling those of the Ké Islands (Chap. XXIX.) It was accompanied by a brilliancy and luxuriance of the veretation, very like what I had observed at those islands, which so mach pleased me that I resolved to stay a few days at the chief village, and see if their animal prodncthons were conespondingly interesting. While searching for a secure anchorage for the night wo again saw the

[^6]comet, still apparently as brilliant as at first, but the tail haid now risen to a higher angle.

October 14th.-All this day we consted along the Kaion Ishands, which have much the appearance and outline of Ké on a small scale, with the addition of flat swampy tracts along shore, and outlying coral reefs. Contrary winds and currents had prevented our taking the proper course to the west of them, and we had to go by a circuitous route round the southern extremity of one island, often laving to go far out to sea on account of coral ruefs. On trying to pass a channel through one of these reffs we were grounded, and all had to get out into the water, which in this shallow strait had been so heated by the sun as to be disagreeably warm, and drag our vessel a considerable distance among weeds and sponges, corals and prickly corallines. It was late at night when we reached the little village harbour, and we were all pretty well knocked up by hard work, and having had nothing but very brackish water to drink all day-the best we could find at our last stopping-place. There was a house close to the shore, built for the use of the Resident of Ternate when he mate his official visits, but now occupied by several native travelling merchants, among whom I found a place to sleep.

The next morning early I went to the village to find the "Kapala," or head man. I informed him that I wanted to stay a few days in the house at the landing, and beged him to have it made ready for me. He was very civil, and cane down at once to get it cleared, when we found that the traders had already left, on hearing that I required it. There were no doors to it, so I obtained the loan of a couple of hurdles to keep out dogs and other animals. The land here was evidently sinking rapidly, as shown by the number of trees standing in silt water dead and dying. After breakfast I started for a walk to the forest-covered liill above the village, with a couple of boys as guides. It was exceedingly hot and dry, no rain having fallen for two montlis. When we reached an elevation of about two hundred feet, the coralline rock which fringes the shore was succeeded by a hard crystalline rock, a kind of metamorphic sandstone. This would indicate that there had
been $a$ recent elevation of more than two hundred feet, which had still more recently changed into a movement of subsidence. The hill was very rugged, but among dry sticks and fallen trees I found some good insects, mostly of forms and species I was already acquainted with from Ternate and Gilolo. Finding no good paths I returned, and explored the lower ground eastward of the village, passing through a long range of plantain and tobaceo grouuds, encumbered with felled and burat logs, on which I found quantities of beetles of the family Buprestide of six different species, one of which was new to me. I then reached a path in the swampy forest where I hoped to find some butterilies, but was disappointed. Being now pretty well exhausted by the intense heat, I thought it wise to return and reserve further exploration for the next day.

When I sat down in the afternoon to arrange my insects, the house was surrounded by men, women, and children, lost in amazement at my unaccountable proceedings; and when, after pinning out the specimens, I proceeded to write the name of the place on small circular tickets, and attach one to each, even the old Kapala, the Mahometan priest, and some Malay traders could not repress signs of astonishment. If they had known a little more about the ways and upinions of white men, they would probably lave looked upon me as a fool or a madman, but in their ignorance they accepted my operations as worthy of all respect, although utterly beyond their comprehension.

The next day (October 16th) I weat beyond the swamp, and found a place where a new clearing was being made in the virgin forest. It was a long and hot walk, and the search anong the fallen trunks and branches was very fatiguing, but I was rewarded by obtaining about seventy distinct species of beetlos, of which at least a dozen were new to me, and many others rare and interesting. I have never in my life seen beetles so abundant as they were on this spot. Some dozen species of good-sized roblen Buprestidx, green rose-chafers (Lomaptera), and long-horned weevils (Anthribide), were so abundant that they rose up in swarms as I walked along, filling the air with a loud buzzing hum. Along with these, several fine Longicorus
were atmost equally common, forming such an assemblage as for once to realize that ilea of tropical luxurinuce which one obtains by looking over the trawers of a well-filled cabinet. On the under sides of the trunks clung numbers of smaller or more slurgish Longicoms, while on the branches at the elge of the elearing others could be detected sitting with outstretched antenure realy to take tlight at the least alarm. It was a glorious spot, and one which will always live in my memory as exhibiting the insect-life of the tropics in unexamplei luxuriance. For the three following days I contimued to visit this locality, adding each time many mew species to my collection-the following notes of which may be interesting to entomologists, October 15th, 33 species of beetles; 16 th, 70 species; $17 \mathrm{th}, 47$ species; $18 \mathrm{H}_{\mathrm{h}}$, 40 species; 19 th, 56 species-in all about a hundred species, of which forty were new to me. There were forty-fur species of Longicoms among them, aml on the last day I took twentyeight species of Longicorns, of which five were new to me.

My boys were less fortunate in shooting. The only hirls at all common were the great red parrot (Liclectus grandis), fonnd in most of the Moluceas, a crow, and a Megaporius, or mound-maker. A few of the pretty racquet-tailed kinglishers were also obtainet, lut in viry poor phumage. They proved, however, to be of a diflerent species from those found in the other islands, and come nearest to the hird origimally described by Limmas nuler the name of Aleato dea, and which came from Ternate. This would indicate that the small chain of ishands parallel to Gilolo have a lew peculiar species in common, a fiet which certainly oceurs in inseds.

The people of Kaióa interested me much. 'They are exidently a mixed mee, havine Mahay and Papman aflinities, amd are allied to the perntes of Termate and of Cilolo. Thy possess a peouliar languase, somewhat resembling thase of the surronuding islands, bat quite distinct. They are now Mahometans, and are subject to Ternate. The only fruits seen here ware papaws and pine-apples, the rocky soil and dry climate being untavouralile. Lice, maize, and plantains flourish well, except that they suffer from occasional dry seasons like the present one. There is a
little cotton grown, from which the women weave sarongs (Malay petticoats). There is only one well of good water on the islands, situated close to the landing-place, to which all the inlabitants come for drinking water. The men are good boat-builders, and they make a regular trade of it and seem to be very well off.

After five days at Kaión we continued our journey, and soon got among the narrow straits and islands which lend down to the town of Batchian. In the evening we stayed at a settlement of Galéla men. These are natives of a district in the extreme north of Gilolo, and are great wanderers over this part of the Archipelago. They build large and roomy praus with outriggers, and settle on any coast or island they take a fancy for. They hunt deer and wild pig, drying the meat; they catch turtle and tripang; they cat down the forest and plant rice or maize, and are altogether remarkably energetic and industrious. They are very fine people, of light complexion, tall, and witl Papuan features, coming nearer to the drawings and descriptions of the true Polynesians of Tahiti and Owyhee than any I have seen.

During this voyage I lad several times had an opportunity of secing my men get fire by friction. A sharpedged piece of bamboo is rubbed across the convex surface of another piece, on which a small notch is first cut. The rubbing is slow at first and gradually quicker, till it becomes very rapid, and the fine powder rubbed off ignites and falls through the hole which the rubbing has cut in the bamboo. This is done with great quickness and certainty. The Ternate people use bamboo in another way. They strike its flinty surface with a bit of broken china, and produce a spark, which they catch in some kind of tinder.

On the evening of October 21st we reached our destination, having been twelve days on the voyage. It had been fine weather all the time, and, although very hot, I had enjoyed myself exceedingly, and had besides obtained some experience in boat work among islands and coral reefs, which enabled me afterwards to undertake much longer voyages of the same kind. The village or town of Batchian is situated at the head of a wide and deep bay,
where a low isthmus connects the northern and southern mountainous parts of the island. To the south is a fine range of mountains, and $I$ had noticed at several of our landing-places that the geological formation of the island was very different from those around it. Whenever rock was visible it was either sandstone in thin layers, dipping south, or a pebbly conglomerate. Sometimes there was a little coralline limestone, but no volcanic rocks. The forest had a dense luxuriance and loitiness seldom found on the dry and porous lavas and raised coral reefs of Ternate and Gilolo; and hoping for a corresponding richness in the birds and insects, it was with much satisfaction and with considerable expectation that I began my explorations in the hitherto unknown island of Batchian.

## CHAPTER XXIV.

## Batchlan.

## (ogtoben 1858 to april 1859.)

ILANDED opposite the house kept for the use of the Resident of Teruate, and was met by a respectable middle-aged Malay, who told me he was Secretary to the Sultan, and would receive the official letter with which I had been provided. On giving it him, he at once informed me I might have the use of the official residence which was empty. I soon got my things on shore, but on looking about me found that the house would never do to stay long in. There was no water except at a considerable distance, and one of my men would be almost entirely occupied getting water and firewood, and I should myself have to walk all through the village every day to the forest, and live ahuost in public, a thing I much dislike. The rooms were all boarded, and had ceilings, which are a great nuisance, as there are no means of hanging anything up except by driving nails, and not half the conveniences of a native bamboo and thatch cottage. I accordingly
inquired for a house outsile of the village on the roul to the coal mines, and was informed by the Secretary that there was in small one belonging to the Sultan, and that he would go with me early next morning to see it.

We had to pass one large river, by a rude but substantial bridge, and to wale through another fine pebbly stream of elear water, just beyond which the little hut was situated. It was very small, not raised on posts, but with the earth for a tloor, and was built almost entirely of the leaf-stems of the sago-palm, called here "gaba-gaba." Across the river belind rose a forest-clad bank, and a grood road close in front of the honse led through cultivatel grounds to the forest about half a mile on, and thence to the coal mines four miles further. These advantages at once decided me, and I told the Secretary I would be very glad to occupy the house. I therefore sent my two men immediately to buy "ataps" (palm-leaf thatch) to repair the roof, and the next day, with the assistance of eight of the Sultan's men, got all my stores and furniture carried up and pretty comfortably arranged. $A$ rough bamboo bedstead was soon constructed, and a table made of boards which I had brought with me, fixed under the window. Two bamboo chairs, an easy cane chair, and hanging shelves suspended with insulating oil cups, so as to be safe from ants, completed my furnishing arrangements.

In the afternoon succeeding my arrival, the Secretary accompanied me to visit the Sultan. We were kept waiting a few minutes in an outer gate-honse, and then ushered to the door of a rude, hall-fortified whitewashed house. A small table and three chairs were placed in a large onter corridor, and an old dirty-faced man with grey hair and a grimy bearl, dressed in a speckled blue cotton jacket and loose red trousers, came forward, shook hands, and asked me to be seated. After a quarter of an hour's conversation on my pursuits, in which his Majesty seemed to take great interest, tea and cakes-of rather better quality than usual on such recasions-were brought in. I thanked him for the house, and ofierel to show him my collections, which he promised to come and look at. He then asked me to teach him to take views-to make maps-to get him a small gun from England, and a milch-grat from Bengal;
oll of which refuests I evaded as skilfully as I was able, and we parted very grood friends. ILe seemed a sensible ohd man, and lamented the small population of the island, which he assured me was rich in many valuable minerals, including fold; but there were not pemple enongh to look alter them and work them. I described to him the great rush of population on the discovery of the Australiatu gold mines, and the hage nurets fonnd there, with which he was much interested, and exchamed, "Oh! if we had but people like that, my country would be quite as rich !"

The morning atter I had got into my new lanse, I sent my boys out to sloot, and went myself to explore the road to the coal mines. In less than half a mile it entered the virgin forest, at a place where some magniticent trees formed a kind of natural avenue. The first part was llat and swampy, but it soon rose a litile, and ran alongside the fine stream which passed behind my house, and which here rushed and gurgled over a rocky or pebbly bed, sometimes leaving wide sandbanks on its marsiss, and at other places flowing between high banks cronind with a varied and marnificent forest vegetation. After ahout two miles, the valley narrowed, and the road was canved along the steep hill-side which rose abruptly from the water's edge. In some places the rock had been cut away, but its surface was already covered with elegant fems and creppers. Gigantic tree-ferns were abundant, and the whole forest had an air of luxuriance and rich viriety which it never attains in the dry volcanic soil to which I had been lately accustomed. A little further the road passed to the other side of the valley by a bridge across the stream at a place where a great mass of rock in the middle offered an excellent support for it, and two miles more of most picturesque and interesting road brought me to the mining establishment.

This is situated in a large open space, at a spot where two tributaries fall into the main stream. Several forestpaths and new elearings offered fine collecting grounds, and I captured some new and interesting insects; but as it was getting late I hod to reserve a more thorough exploration for fiture oceasions. Coal had been discovered here some yeurs before, and the road was made in order to
for coloneved plitus ive Ihis 1860 pl: 2.

[^7]bring down a sufficient quantity for a fair trial on the Dutch steamers. The quality, however, was not thought sufficiently good, and the mines were abandoned. Quite recently, works had been commenced in atuther spot, in hopes of tinding a better vein. There were about eighty men employed, chietty convicts; but this was far too small a number for minine onerations in such a country, where the were keeping a few miles of road in repair requires the constant work of several men, If coal of suaticitutly good quality should be foumb, at tranroad would be made, and would be very ensily worked, owing to the regular descent of the valley.

Just as I got home I overtook Ali returaing from shooting with some birds langing from his beit. He seemed much pleased, and said, "Look here, sir, what a eurious bird,' holding out what at first completely puzzled me. I saw a bird with a mass of splentid green feathers on its breast, elongated into two glittering tufts; but, what I could not understand was a pair of long white feathers, which stuck straight out from each shoulder. Ali assured me that the bird stuck them out this way itself, when Iluttering its wings, and that they had remained so without his tonching them. I now saw that I had got as great prize, no less than a completely new form of the Bird of l'aradise, differing most remarkably from every other known bird. The general plamage is very sober, being a pure ashy olive, with a purplish tinge on the back; the crown of the head is beatilully glossed with pale metallic viclet, and the feathers of the front extend as mueh over the beak as in most of the fimily. The neck and breast are scaled with fine metallic green, and the feathers on the lower part are elongated on each side, so as to form a two-pointed gorget, which can be folded beneath the wings, or partially erected and spread out in the same way as the side plumes of most of the birds of paradise. The four lung white plumes which give the bird its altogether unique character, spring from little tubercles close to the upper edge of the shoulder or bend of the wing; they are narrow, gently curvel, and equally webbed on both sides, of a pure creamy white colour. They are about six inches long, equalling the wing, and can be raised at right angles to it,
or laid aloug the body at the pleasure of the bird. The bill is horn culour, the legs yellow, and the iris pale olive. This striking novelty has been named ly Mr. G. A. Gray of the British Museum, Semioptera Wallacei, or "Wallace's Standard wing."

A few days later I obtained an exceedingly benutiful new butterlly, allied to the fine blue Pirpilio Ulysses, but differimg from it in the colom being of a more intense tint, and in having a row of blue stripes around the margin of the lower wings. This good beginning was, however, rather deceptive, and I soon formd that insects, and especially butterthies, were somewhat scarce, and birds in far less variety than I had anticipated. Several of the fine Moluccan species were however obtained. The handsome red dory with green wings and a yellow spot in the back (Lorius garrulus), was not uncommon. When the Jumbu, or rose apple (Eugenia sp.), was in flower in the village, flocks of the little lorikeet (Charmosyna placentis), already met with in Gilolo, came to feed upon the nectar, and I obtained as many specimens as I desired. Another beautiful bird of the parrot tribe was the Geoffroyus cyanicollis, a green parrot with a red bill and head, which colour shated on the crown into azure blue, and thence into werditer blue and the green of the back. T wo large and handsome fruit pireons, with metallic green, ashy, and rufous plunage, were not uncommon; and I was rewarded hy finding a splendid deep llue roller (Eurystonus azureus), a lovely grollen-capped sunbird (Nectarinea auriceps), and a fine racquet-tailed kingfisher (Tanysiptera isis), all of which were entirely new to ornithologists. Of insects I obtained a considerable number of interesting beetles, including many fiue longicorns, anong which was the largest and handsomest species of the genus Glenea yet discoveral. Among butterllies the beantiful little Danis sebe was abundant, making the forests gay with its delicate wings of white and the richest metallic blue; while showy l'apilios, and pretty l'ieride, and dark, rich Eupleas, many of then new, furnished a constant source of interest and plensing occupation.

The istand of Batchim possesses no really indigenous inhabitants, the interior beivg altogether uninhabited, and
there are only a few small villages on various parts of the const; yet I found here four distinct races, which would wofnlly mislead an ethological traveller unathe to ohtain information as to their origin. First there me the Batchian Malays, probahly the earliest colonists, differing very little from those of Ternate. Their language, however, seems to lave more of the I'apuan element, with a mixture of pure Malay, showing that the settlement is one of stragglers of various races, although now sulficiently homngeneous. Then there are the "Orang Sirani," as at Ternate and Amboyna. Many of these have the Portucuese physiognomy strikingly preserved, but combined with a skin generally darker than the Malays. Some national customs are retained, and the Malay, which is their only language, contains a large number of Portuguese words and idioms. The third race consists of the Galela men from the north of Gilolo, a singular people, whom I have already described; and the fourth is a colony from Tomoré, in the eastern peninsula of Celebes. Theso people were brought here at their own request a few years ago, to avoid extermination by another tribe. They have a very light complexion, open Tartar physiognomy, low stature, and a language of the Bugis type. They are an industrious agricultural people, and supply the town with vegetables. They make a good deal of bark cloth, similar to the tapa of the Polynesians, by cutting down the proper trees and taking off large cylinders of bark, which is beaten with mallets till it separates from the wood. It is then soaked, and so confinmonsly and regularly beaten out that it becomes as thin and as tough as parchment. In this form it is much used for wrappers for clothes; and they also make jackets of it, sewn neatly together and stained with the juice of another kind of bark, which gives it a dark red colour and renders it nearly waterproof.

Here are four very distinct kinds of people who may all be seen any day in and about the town nl Batchian. Now if we suppose a traveller ignorant of Malay, picking up at word or two here and there of the "Batehian language," and noting down the "physical and moral peculiarities, mamers, and customs of the Batchian people"-(for there are travellers who do all this in four-and-twenty hours) -
what an accurate and instructive uhapter we should have! what transitions would be pointed out, what theories of the orisfin of races would bo develoneal! while the next traveller might flatly contradict every statement and arrive at exactly opposite conclusions.

Soon after I arrivel here the Duteh Govermment introduced a new copper coinage of couts instern of doits (the 100th instead of the 120 th part of a guildery, and all the old coins were ordered to be sent to Tumate to be changed. I sent a bag containing 6,000 doits, and duly received the new money by return of the boat. When Ali went to loring it, however, the captain required a written order; se I wated to send again the next day, and it was lucky I did so, for that night my house was entered, all my hoxes carried ont and ransacked, and the various articles left on the road ahout twenty yarls off, where we found them at five in the moming, when, on getting up and finding the: honse empty, we mishen out to discover tracks of the thicves. Not beins able to find the copper money which they thought I hat just received, they decamped, takimg nuthing but a few yards of coiton clotly and a black cont and trousers, which latter were picked up a few days afterwants lidden in the grass. There was no doubt whatever who were the thieves. Conviets are employed to guard the Government stores when the hoat arrives from Temate. Two of them watch all night, and often take the oprortunity to roam about and commit robberies.

The next day I received my money, and secured it well in a strong lox fasteneal under my bed. I took out five or six hondred cents for daily expenses, and put them in a small japamed box, which always stood upon my table. In the afternoon I went for a slort walk, and on my return this box and my keys, which I had carelessly left on the table, were gone. Two of my boys were in the honse, but had heard nothing. I immediately gave information of the two robleries to the Director at the mines and to the Commandant at the fort, and grot fur answer, that if I caught the thief in the act I might shont him. IBy inquiry in the village, we afterwards found that one of the convicts who was on duty at the Govermment rice-store in the yillage had quitted his guard, was seen to pass over the bridge
towards my house, was seen again within two hundred yards of my house, and on returning over the bridge into the village carried something under lis arm, carefully covered with his sarong. My box was stolen between the hours he was seen going and returning, and it was so small as to be easily carried in the way described. This seemed pretty clear circumstantial evidence. I accused the man and brought the witnesses to the Commandant. The man was examined, and conlessed having gone to the river close to my house to bathe; but sail he had gone no further, having climbed up a cocoa-nut tree and brought home two nuts, which he hal covered over, because he was ushomed to be seen corrying them! This explanation was thought satisfactory, and he was acquitted. I lost my cash and my hox, a seal I much valued, with other small articles, and all my keys-the severest loss by far: Luckily my large cash-box was left locked, but so were others which 1 required to open immediately. There was, however, a very clever blacksmith employed to do ironwork for the mines, and he picked my locks for me when I required them, and in a few days made me new keys, whieh I used all the time 1 was abroad.

Towards the end of November the wet season set in, and we had daily and almost incessant rains, with only about one or two hours' sumshine in the moming. 'The flat parts of the forest became flooded, the roads filled with mud, and insects and birds were seareer than ever. On December 13th, in the afternoon, we had a sharp carthquake shock, which made the house and furniture shake and rattle for five minutes, and the trees and shrubs wave as if a gust of wind had passed over them. About the middle of December I removed to the village, in order more easily to explore the district to the west of it , and to be near the sea when I wished to return to Ternate. I obtained the use of a gool-sized house in the Campong Sirani (or Christian village), and at Christmas and the New Year had to endure the incessant gun-firing, drumbeating, and fiddling of the inhabitants.

These people are very fond of music and dancing, and it woutd astonish a European to visit one of their assemblies. We euter a gloomy palm-leaf hut in which two or three
very dim lamps barely render darkness visible. The floor is of black sandy earth, the roof hid in a smoky impenetrable blackness; two or three lenches stand against the walls, and the orchestra consists of a fiddle, a fife, a drum, and a triangle. There is plenty of company, consisting of young menand women, all very neatly dressed in white and black-a true Portuguese habit. Quadrilles, waltzes, polkas, and mazurkas are danced with grent vigour and much skill. The refreshments are muddy coffee and a few swectmeats. Dancing is kept up for hours, and all is conducted with much decorum and propriety. A party of this kind meets about once a week, the principal inhabitants taking it by turns, and all who please come in without much ceremony.

It is astonishing how little these people have altered in three hundred years, although in that time they have changed their language and lost all knowledge of their own nationality. They are still in manners and appearance almost pure Portugnese, very similar to those with whom I had become acquainted on the banks of the Amazon. They live very poorly as regards their house and furniture, but preserve a semi-European dress, and have almost all full suits of black for Sundays. They are nominally Protestants, but Sunday evening is their grand day for music and dancing. The men are often good lunters; and two or three times a week, deer or wild pigs are brought to the village, which, with fish and fowls, enables them to live well. They are almost the only people in the Archipelago who eat the great fruit-eating bats called by us " tlying foxes." These ugly creatures are considered a great delicacy, and are much sought after. At about the leginning of the year they come in large flocks to eat iruit, and congregate during the day on some small islauds in the bay, hanging by thousands on the trees, especially on dead ones. They cas then be easily caught or knocked down with sticks, and are brouglit home by baskets-full. They require to be carefully prepared, as the skin and fur has a rank and powerful foxy odour; but they are generally cooked with abundance of spices and condiments, and are really very good eating, something like hare. The Orang Sirani are good cooks,
having a much greater variety of savoury dishes than the Malays. Here, they live chielly on sago as bread, with a little rice occasionally, aud abundance of vegetables and fruit.

It is a curious fact that everywhere in the East where the Portuguese have mixed with the mative races they have become darker in colour than either of the parent stocks. This is the case almost always with these "Orang Sirani" in the Moluccas, and with the Portuguese of Malacea. The reverse is the case in South America, where the mixture of the Portuguese or Prazilian with the Indian produces the " Mamelnea," who is not unfrequently lighter than either parent, and always lighter than the Indian. The women at Batchian, although generally fairer than the men, are coarse in features, and very far inferior in beauty to the mixed Dutch-Malay girls, or even to many pure Malays.

The part of the village in which I resided was a grove of cocoa-nut trees, and at night, when the dead leaves were sometimes collected togrether and burnt, the effect was most magnificent-the tall stems, the fine crowns of foliage, and the immense fruiteclusters, being brilliantly illuminated against a dark sky, and appearing like a fairy palace supported on a hundred columns, and groined over with leafy arches. The cocoa-nut tree, when well grown, is certainly the prince of pulms both for beauty and utility.

During my very first walk into the forest at Batehian, I had seen sitting on a leaf out of reach, an immense butterfly of a dark colour marked with white and yellow suots. I could not capture it as it flew away ligh up into the forest, but I at once saw that it was a female of a new species of Ornithoptera or "bird-winged butterfly," the pride of the Eastern tropies. I was very anxious to get it and to find the male, which in this genus is always of extreme beaty. During the two succeeding months I only saw it once again, aud shortly afterwards I saw the male flying high in the air at the mining village. I had begun to despair of ever getting a specimen, as it seemed so rave and wild; till one day, about the beginning of Junuary, I fouml a beautiful shrub with large white leafy bracts and yellow flowers, a species of Mussenda, and saw
nue of these noble insects hovering over it, but it was too quick for me, and tlew away. The next day I went again to the same shrub and succeeded in catching a female, and the day after a fine male. I fund it to be as I had expected, a perfectly new and most magnificent species, and one of the most gorgeously coloured buttertlies in the world. Fine specimens of the mate me more than seven inches across the winge, which are velvety black and fiery orange, the latter coluur replacing the green of the allied species. The beaty and brilliney of this insect are indescribahle, and none but a naturalist can understand the intense excitement I experienced when I at length captured it. On taking it out of my net and opening the glorious wings, my heart began to beat violently, the blood rushed to my head, and I felt much more like fainting than I have done when in apprehension of immediate death. I had a headache the rest of the day, so great was the excitement produced by what will appear to most people a very inadequate cause.

I had deciden to retmon to Ternate in a week or two more, but this urand capture determined me to stay on till I obtained a good series of the new butherty, which I have since mamed Oruithoptera crosus. The Mussenda hush was an alumirable place, which I could visit every day ou my way to the forest; and as it was situated in a dense thicket of shouhs and creepers, I set my man Lahi to clear a space all romm it, so that I could easily get at any insect that might visit it. Afterwards, finding that it was olten necessary to wait some time there, I had a little seat put up under a tree by the side of it, where I came every day to cat my lunch, and thus had half an hour's watching about nom, hesides it chance as I passed it in the morning. In this way I oltained on an averade one specimen a day for a long time, but more than half of these were females, and more than half the remander wom or broken specimens, so that I should not have obtained many perfect males had I not foumd another station for them.

As som ins I had seen them come to llowers, I sent my man Lalni with a net on purpose to soarch fur them, as they hanl also haen seen at some Howering trees on the beach, and I promised him half a day's wages extra for
every good specimen he conld catch. After at day or two he bronglit me two very fair specimens, and told me lie had caught them in the bed of a large rocky stream that descends from the mountains to the sea about a mile below the village. They flow down this river, settling occasimally on stones and rocks in the water, and lie was obliged to wade up it or jump from rock to rock to get at them. I went with him one day, but found that the stream was far too rapid and the stones too slippery for rae to do anything, so I left it entirely to him, and all the jest of the time we stayed in Batchian he used to be out oll day, generally bringing me one, aud on good days two or three specimens. I was thus able to bring away with pae more than a hundred of both sexes, including perhaps twenty very fine males, though not nore than five or six that were absolutely perfect.

My daily walk now led me, first about half a mile along the sandy beach, then through a sago swamp over a canseway of very shaky poles to the village of the Tonore people. Beyond this was the forest with patches of new clearing, shady paths, and a considerable quantity of felled timber. I foumd this a very fair collecting ground, especially for beetles. The falleu trunks in the clearinus abounded with golden Buprestida and curious Brenthiule and longicorns, while in the forest I found aboudance of the smaller Curculiunide, many longicorns, and some fine green Carabide.

Bulterflies were not abundant, bul I obtained a few more of the fine blue Papilio, and a number of heautiful little Lycenidex, as well as a simgle specimen of the very rare lapilio Wallacei, of which I had taken the hitherto unique specimen in the Aru Islands.

The most interesting lirds I obtained here, were the beautiful blue kingfisher, Todiramphus diops; the fine green and purple doves, Ptilonopus superbus and 1 . iogaster, and several new birds of small size. My shooters still brought me in specimens of the Semiopten Wallacei, and I was greatly excited by the positive statements of several of the native hunters that another species of this bird existed, much handsoner and more remarkable. They dechared that the phumare was glossy black, with metallic
green breast as in my species, but that the white shoulder plumes were twice as long, and hung down far below the body of the bind. They deelared that when hunting pigs or deer far in the forest they occasionally saw this hird, but that it was rare. I immediately offered twelve guilders (a pound) for a specimen ; but all in vain, and I am to this day uncertain whether such a bird exists. Since I left, the German naturalist, Dr. Bernstein, stayed many montlis in the island with a large stafi of huters collecting for the Leyden Museum ; and as he was not more successful than myself, we must consider either that the lird is very rare, or is altogether a myth.

Batchion is remarkable as being the most castern point on the globe inhalited by any of the Quadrumana. A large black baboon-monkey (Cynopitheeus nigrescens) is abundant in some parts of the forest. This animal has bare red callosities, and a rudimentary tail about on inch Long-a mere fleshy tubercle, which may be very easily overlooked. It is the same species that is found all over the forests of Celebes, and as none of the other Mammalia of that island extend into Batchian I atn inclimed to suppose that this species has been accidentally introduced by the roaming Malays, who often carry abont with them tame monkeys and other animals. This is rendered more probable by the fact that the animal is not found in Gilolo, which is only separated from Batchian by a very narrow strait. The introduction may have been very recent, as in a fertile and unoceupied island such an animal would multiply tapidly. The only other mammals ohtained were an Eastern opossum, which 1)r. Gray has described as Cuscus ornatus; the little flying opossum, Belideus ariel; a Civet eat, Viverra zelectha; and nine species of bats, most of the smaller ones heing canglit in the dusk with my butterlly net as they flew about before the house.

After much delay, owing to bad weather and the illness of one of my men, I determined to visit Kasserota (formerly the chief village), situated up a small stream, on in ishand close to the north const of latchian; where I was told that many rare birds were fomb, After my boat was loaded and everything ready, thee days of
heavy squalls prevented our starting, and it was not till the 2 Lst of Mareh that we got away. Early next morning we entered the little river, and in about an hour we reached the Sultan's house, which I had obtainel permission to use. It was situated on the bank of the river, and surrourded by a forest of fruit trees, anong which were some of the very loftiest and most graceful cocon-nut palms I have ever seen. It rained nearly all that day, and I could do little but unload and unpack. Towards the atternoon it cleared up, and I attempted to explore in various directions, lut fonad to my disgust that the ouly path was a perfect mud swamp, along which it was almost impossible to walk, and the surromding forest so damp and tark as to promise little in the way of insects. I found too on inquiry that the people here made no clearings, living entirely on sago, fruit, fish, and ginne; and the path only led to a step rocky momatain equally inprace ticable and unproductive. The next day I sent my men to this hill, hoping it might produce some good birds; but they returned with only two eommon species, aud I myself had been able to get nothing, every little track I had attempted to follow leading to a dense sago swamp. I saw that I should waste time by staying here, and determined to leave the following day.

This is one of those spots so hard for the European naturalist to conceive, where with all the riches of a tropical vegetation, and partly perhaps from the very luxuriance of that vegetation, insects are as scarce as in the most barren parts of Europe, and hardly more conspichous. In temperate climates there is a tolemale uniformity in the distribution of insects over those furts of a country in which there is a similarity in the vegetation, any deficiency being easily accounted for by the absence of wood or unifornity of surface. The traveller hastily passing through such a country can at once pick out a collecting ground which will affiond him a fink notion of its entomolugy. Here the case is different. There are certain requisites of a good collecting groumd which eau only be ascertaned to exist lyy some days search in the vicinity of each willate In some phaces there is no virgin forest, as at Djiluh and Salhow; in
others there are no open pathways or clearings, as liere. At Batchian there are only two tolerahle collecting places, -the road to the coal mines, and the new clearings made by the Tomore people, the latter being hy far the most productive. I believe the fact to be that insects are pretty uniformly distributed over these countries (where the forests have not been cleared away), and are so searce in any one spot that searching for them is almost useless. If the forest is all cleared away, ahmost all the insects disappear with it ; but when small clearings and paths are made, the fallen trees in various stages of drying and decay, the rotting leaves, the loosening bark and the fungoid growths upon it, together with the flowers that appear in much greater abundance where the light is admitted, are so many attractions to the insects for miles aromnd, and canse a wonderfind accumulation of species and individuals. When the entumologist can discover such a spot, he does more in a montl than he could possibly do by a years search in the depths of the modisturbed forest.

The next morning we left early, and reached the mouth of the little river in about an honr. It flows through a perfectly flat alluvial phain, hut there are hills which approach it near the mouth. Howards the lower part, in a swamp where the salt-water must enter at hight tides, were a number of elegant tree-ferms from eight to fitteen feet high. These are generally considered to be mountain plants, and rarely to ocenr on the equator at an elevation of less than one or two thousand feet. In Borneo, in the Aru Islands, and on the bankz of the Amazon, I have observed them at the level of the sea, and think it probable that the altitude supposed to be requisite for them may have been dedaced from facts observed in comntries where the plains and lowlands are largely cultivated, and must of the muligenous vegetation destroyen. Such is the case in most parts on Jawa, India, Janaica, and Brazil, where the vegetation of the tropies has been most fully explored.

Coming out to seal we turned northwards, and in about two hours' sall reached a few louts, called Langundi, where some Galela men had establishad themselves as collectors of sum-dimmar, with which they made torches for the supply of the Temate market. About a hundred yards
back rises a rather steep hill, and a short walk having shown me that there was a tolerahle path up it, I determined to stay here for a few days. Opposite us, and all along this coast of Batchian, stretelies a row of tine islands completely minhabited. Whenever I asked the reason why no one goes to live in them, the answer always was, "For fear of the Magindano pirates." Every year these scourges of the Archipelago wander in one direction or another, making their rendezvous on some uninhibited island, and carrying devastation to all the small settlements aroumd; robbing, destroying, killing, or taking captive all they meet with. Their long well-manned prans escape from the pursuit of any sailing vessel by pulling away right in the wind's eye, and the warning smoke of a steamer generally enables them to hide in some shallow bay, or narrow river, or forest-covered inlet, till the danger is passed. The only effectual way to put a stop to their depredations would be to attack them in their strongholds and villages, and compel them to give up piracy, and submit to strict surveillance. Sir James Brooke did this with the pirates of the north-west coast of horneo, and deserves the thanks of the whole population of the Archipelago for haviag rid them of half their enemics.

All along the beach here, and in the adjacent strip of sandy lowland, is a remarkable display of l'andanaceie or Screw-pines. Some are like huge branching candelabra, forty or fifty feet high, and bearing at the end of each branch a tuft of immense sword-shaped leaves, six or eight inches wide, and as many feet long. Others have a simgle unbranched stem, six or seven feet high, the upper pirt clothed with the spirally arranged laves, and beariog a single terminal fruit as large as a swan's egg. Others of intermediate size have irregular clusters of rough red fruits, and all have more or less spiny-edged leaves and ringed stems. The young plants of the larger species have smooth glossy thick leaves, sometimes ten feet long and eight inches wide, which are used all over the Molucens and New Gumea, to make "cocoyas" or sleeping mats, which are often very prettily ornamented with coloured patterns. Higher up on the hill is a forest of immense trees, among which those producing
the resin called dammar (Dammara sp.) are abmondant. The inhabitants of several small villages in Patehina are entively engaged in searehing for this product, and making it into torches by pounding it and filling it into tubes of paln leaves about a yard long, which are the only lights used by many of the natives. Sonetimes the dammar ateumulates in large masses of ten or twenty pounds weight, either attached to the trunk, or found buried in the ground at the foot of the trees. The most extraordinary trees of the forest are, however, a kind of fig, the aerial roots of which form a pyramid near a hundred feet high, terminating just where the tree branches out above, so that there is no real trunk. This pyranid or cone is formed of roots of every size, mostly descending in straight lines, but more or less obliquely-and so crossing each other, and comected by cross branches, which grow from one to another ; as to form a dense and complieated network, to which nothing but a photograph could do justice (see illustration at page 83). The Kanary is also abmodant in this forest, the mut of which lias a very agreeable flavour, and produces an excellent oil. The fleshy outer covering of the nut is the favourite food of the great green pigeons of these islands (Carpophaga perspicillata), and their hoase cooings and heavy flutterings among the branches can be almost continually heard.

After ten days at Langundi, finding it impossible to get the bind I was particularly in search of (the Nicolar pigeon, or a new species allied to it), and finding no new birds, aud very few insects, I left early on the morning of April 1st, and in the evening entered a river on the main istaml of Batchian (Lingumdi, like Kasserota, beiug on a distinct island), where some Malays and Galela men have a small village, and have mate extensive rice-fields and plantain grounds. Here we found a good house near the river bank, where the water was fresh and clear, and the owner, a respectable batehtian Malay, offered me sleeping room and the use of the verandah if I liked to stay. Seem forest all round within a short distance, I aceented his offer, and the next moming before breakfast walked out to explore, and on the skirts of the forest canitural a few interesting insects.

Afterwards, I found a path which led for a mile or more through a very fine forest, richer in palms than any I had seen in the Moluceas. One of these especially attracted my attention from its elergance. The stem was not thicker than my wrist, yet it was very lofty, and bore elusters of bright red fruit. It was apparently a species of Areca. Another of immense height closely resembled in appearante the Euterpes of South America. Here also grew the fin-leated palm, whose small, nearly entire leaves are used to make the dammar torches, and to form the water-buckets in miversal use. During this walk I snw near a draen species of palins, as well as two or three Pandani different from those of Langudi. There were also some very fine climbing ferns and true wild Plantains (Musa), bearing an edible fruit not so large as one's thumb, and consisting of a mass of seeds just covered with pulp and skin. The people assured me they had tried the experiment of sowing and cultivating this species, but could not improve it. They probably did not grow it in sufficient quantity, and did not persevere sufliciently long.

Batchian is an island that would perlaps repay the researches of a botanist better than any other in the whole Archipelago. It contains a great variety of surface and of soil, abundance of large and small streams, many of which are navigable for some distance, and there being no savage imhabitants, every part of it can be visited with perfect safety. It possesses gold, copper, and coal, hot springs and geysers, sedimentary and voleanic rocks and comalline limestone, alluvial plains, abrupt hills and lofty mountains, a moist climate, and a grand and luxuriant forest vegetation.

The few days I stayed here produced me several new insects, but scarcely any birds. Buttertlies and birds are in fact remarkably scarce in these forests. Oue may walk a whole day and not see more than two or three species of either. In everything but bectles, these eastern islands are very deficient compared with the western (Java, Bomeo, \&c.), and much more so if compared with the forests of South America, where twenty or thirty species of butterlies may be caught every day, and on very good
days a hondred, a number we can hardly reach here in months of unremitting search. In birds there is the same difference. In most parts of tropieal Ameriea we nay always find some species of womluecker tamager, busht shrike, chatterer, trogon, toucan, cukkoo, and tyrat-llycatcher ; and a few days' active search will produce more variety thon can be here met with in as many months. Yet, along with this poverty of indiviluals and of speedes, there are in almost every elass and order, some one or two species of such extreme beanty on singularity, as to vie with, or even surpass, anything that eren South America can produce.

One atternoon when I was arranging my insects, and surrounded by a crowd of woudering suectators, I showed one of them how to look at a small insect with a hamdlens, which caused such evident wonder that all the rest wanted to see it too. I therefore fixer the glass firmly to a piere of solt wool at the propers forus, und put under it a little spiny beetle of the gemus Hispa, and then passed it rombl for examination. The exeitment was immense. Some declared it was a yard long; others were frightened, and instantly dropped it, and all wore as much astonished, and made as much shouting and gesticulation, as chideren at a pantomime, or at a Christmas exhibition of the oxylydrogen mieroscope. Aud all this excitement was produced by a little pocket lens, an inch and a half locas, and therefore madnifying only four or five times, lout which to their unacenstomed eyes appeared to enlarge a hundredfold.

On the last day of my stay here, one of my hanters succeeded in finding and shooting the beautiful Nionhar pirgeon, of which I bad been so long in search. None of the residents had ever secu it, which shows that it is mare and shy. My specinen was a female in beatiful condition, and the glossy copprey and green of its plamage, the snow-white tail and hemitiful pendent feathers of tho neek, were greatly inlmived. I subsequently obtained a specimen in New Guinea, and once saw it in the Kaióa fslands. It is found also in sone small islands near Macassar, in others near Borneo, and in the Nicobar islands, whence it receives its wane. It is a ground
feeder, only going upon trees to roost, and is a very heavy fleshy bind. This may account for the fact of its being found chielly on very small islands, while in tho western half of the Archipelago, it seems entirely absent from the larger ones. Being a ground feeder it is sulject to the attacks of carnivorous quadrupeds, which are not found in the very small islands. Its wide distribution over the whole length of the Arehipelago, from extreme west to east, is however very extroordinary, since, with the exception of a few of the birds of prey, not a single land lime has so wide a range. Ground-feeding birds are generally doficient in power of extended flight, and this species is so bulky and heavy that it appears at first sight quite unalile to ily a mile. A closer examination shows, however, that its wings are remarkably large, perhaps in proportion to its size larger than those of any ohber pigeon, and its pectoral muscles are immense. A fact communicated to me by the son of my friend Mr. Duivenboten of Temate. would show that, in accordanee with these peculiarities of structure, it possesses the power of llying long listances. Mr. U. established an oil factory on a small coral island, a hundred miles north of New Gninea, with no intervenimg land. After the island had becn settled a year, and traversed in every direction, his son paid it a visit ; and just as the schooner was coming to an anchor, a bird Was seen flying from seaward which fell into the water exhausted before it could reach the shore. $A$ boat was sent to pick it up, and it was found to he a Nicobar pigeon, which must have come from New Guinea, and flown a hundred miles, since nu such bita previously inbabited the island.

This is certainly a very curious caso of adaptation to an unusual and exceptional necessity. The bird does not ordinarily require great powers of light, since it lives in the forest, feeds on fallen fruits, and roosts in low trees like other ground pigeons. The majority of the individuals, therefore, can never make full use of their cnomonsly powerful wings, till the exceptional case occurs of an individual being blown out to sea, or driven to emigrate by the incursion of some carnivorous animal, or the pressure of scarcity of food. A
modification exactly opposite to that which produced the wingless bids (the Apteryx, Cassowary, and Dotob, appears to have here taken place; and it is curious that in both eases an insular habiat should have been the movirg canse. The explanation is probably the same as that applied by Mr. Darwin to the case of the Madeina beetles, many of which are wingless, while some of the winged ones have the wings better develoned than the same species on the continent. It was advantageons to these insects either never to fly at all, and thus not run the risk of being blown out to sea, or to tly so well as to he alle either to return to land, or to migrate safely to the continent. Bad flying was worse than not Hying at all. So, while in such islands as New Zealand and Matritius, far from all lamb, it was safer for a ground-feeding bird not to fly at all, aud the short-winged individuals contimually surviving, prepared the way for a wingless group of birds; in a vast Arehipelaro thickly strewn with ishands and islets it was advantageous to be able oceasionally to migrate, and thes the long and strong-winged varieties maintained their existance longest, and ultinately supplanted all others, and spread the race over the whole Archipelago.

Besides this pigeon, the only new bird I obtained during the trip was a rare goat-sucker (Batrachostomus crinifrons), the only species of the enenns yet found in the Moluceas. Among my inseets the lest were the rare Pieris arma, of a rich chrone yellow colour, with a black border and remarkable white antenat-perhaps the very finest butterfly of the genus; anl a lage black wasp-like insect, with immense jows like a stag-boetle, which has been named Megachile pluto by Mr. F. Smith. I collected about a hundred species of bectles quite new to me, but mostly very mimute, and also many rave and hadsome ones which I had already found in Batchian. On the whole I was tulerathy satisfied with my seventeen days' excursion, which was a very agreeable one, and coabled me to see a grood deal of the island. I had hired a roomy boat, and brought with we a small table and my rattan chair. These were great comforts, as, wherever there was a roof, I could immediately instal myself, and work and
eat at ease. When I could not find accommodition on shore I slept in the boat, which was always drawn up on the beach if we stayed for a few days at oue spot.

On my return to Batchian I parked up my collections, and prepared for my return to Tomate. Whan I first same I had sent back my luat by the pilot, with two or three other men who had been glad of the opportunty: I now took adsantage of a Crovernment lant which had just arrived with rice for the troops, and obtamed permission to return in her, and accordingly started on the L3th of April, having resided only a week shont of six months on the island of latchim. The boat was one of the kind called "Kura-kora," quite ojen, very low, and about four tons burthen. It had ontiggers of hamboo about five feet off each side, which supported at banhoo platform extending the whole length of the vessel. On the extreme outside of this sit the twenty rowers, while within was a convenient passage fore athd att. The middle portion of the boat was covered with a thatch-house, in which hagrage and passengers are stowed; the gunwale was not more than a foot above water, and from the great top and side weight, and general clumsiness, these fanatz are dangerous in heavy weather, and are not unfrequently lost. A triangle mast and mat sail carried us on when the wind was favourable, which (as usual) it never was, althongh, according to the monsoon, it ought to have been. Our water, carried in bamboos, would only last two days, and as the woyse occupied seven, we had to touch at a creat many phaces. The captain was not very energetic, and the men rowed as little as they pleased, or we might have reached Ternate in three days, having had fine weather and little wind all the way.

There were several passengers besides myself : three or four Javanese soldiers, two conviets whose time had expired (one, curiously enongh, being the man who ham stolen my cash-hox and keys), the scl:oolmaster's wife and a servant going on a visit to Ternate, and a Chinese trader going to hay grouls. We had to sleep all together in the cabin, packed pretty close; hut they very civilly allowed me plenty of room for my mattrass, and we got on very well together. There was a litile cook-
house in the bows, where we could boil our rice and make our colliee, every one of course bringing his own provisions, and amanging his meal-times as the found most convenient. The passage would have heen agreeable enough but for the dreadful "tom-toms," or wooden druas, which are beaten incessantly while the men are rowing. Two men were engaged constantly at them, making a fearful din the whole voyage. The rowers are men sent by the Sultan of Ternate. They get about threepence a day, and find their own provisions. Each man had a strong wooden "betel" box, on which he generally sat, a slepping-mat, and a change of clothes-rowing naked, with only a sarong or a waist-cloth. They sleep in their phaces, coverel with their mat, which keeps out the rain pretty well. They elrew betel or smoke cigarettes incessintly; eat dry sago and a little salt fish; selitom sing while rowing, except when excited and wanting to reach a stopping-place, and do not talk a great deal. They are mosily Malays, with a spinkling of Alfuros from Gilolo, and Papuans from Guebe or Waigiou.

One afternoon we stayed at Makian ; many of the men went on shore, and a great deal of plantains, bananas, and other fruits were brought on board. We then went on a little way, and in the evening anchored again. When going to bed for the night, I put out my candle, there being still a glimmering lamp burning, and, missing my handerehiel, thowht 1 saw it on a box which formed one side of my bel, and put ont my hand to take it. I quiekly drew back on feeling something cool and very smooth, which movel is I touched it. "Pring the light, quick," I crind ; "here"s a smake", Aml there ho was, sure enough, niedy coiled up, with his head just raised to inquire who had disturbed him. It was now necessary to eateh or kill him neatly, or he woulh escape among the piles of miseellancous luggage, and we should hadly sleep enufortably. One of the ex-convicts volunteered to catch him with his hand wrapped up in a cloth, but from the way he weat ahont it I saw he was nervous and would let the thing go, so I would not allow him to make the attempt. I then yot a chopping-knife, and carefolly moving my insect nets, which hung just over the snake and prevented me getting
a free blow, I cut him quictly across the back, holding him down while my boy with another knile crushed his head. On examination, I found he had large poison fangs, and it is a wonder he did not bite me when I first tonched him.

Thinking it very unlikely that two suakes had got on board at the same time, I turned in and went to sleep; but having all the time a vagne dreamy idea that I might put my hand on another one, I lay wonderfully still, not turning over once all night, quite the reverse of my nsual habits. The next day we reached Ternate, and I ensconced myself in my comfortable house, to examine fill my treasures, and pack them securely for the voyage home.

## CHAPTER XXV.

CERAM, GORAM, AND THE MATABELLO ISLANDS

## (OcTODETY 1850 TO JUNE 1860.)

ILEFT Amboyna for my first visit to Ceram at three o'clock in the morning of October 29th, after having been delayed several days by the boat's crew, who could not be got together. Captain Yan der Beck, who gave me a pussage in his boat, had been rumning after them all day, and at midnight we had to search for two of my men who had disappeared at the last moment. One we found at supper in his own house, and rather tipsy with his parting libations of arrack, but the other was gone across the bay, and we were obliged to leave without lim. We stayed some hours at two villages near the cast end of Amboyna, at one of which we had to discharge some wood for the missionaries' honse, and on the thind afternoon reached Captain Van der Deek's plantation, sitmated at Hatosúa, in that part of Ceram opposite to the island of Amboyna. This was a clearing in flat and rither swampy forest, about twenty acres in extent, and mostly planted with cacao and tobacco. Besides a small cottage oceupied by the workmen,

there was a large shed for tobaceo drying, a corner of which was offered me; and thinking from the look of the place that I should find gool collecting ground here, I fitted up temporary tables, benches, and beds, and made all preparathons for some werks' stay. A few days, however, selved to show that I should be disappointed. Beetles were tolerably abundant, and I obtained plenty of tine long-homed Anthribide and pretiy Longicorns, bat they were mostly the same species as I lad found during my tirst short visit to Amboyna. There were very few paths in the forest, which seemed poor in bids and butterllies, and day after day my men brought me nothing worth notice. I was therefore soon obliged to think about changing my locality, as I could evidently obtain no proper notion of the productions of the almost entirely unexplored island of Ceram by staying in this place.

I rather regretted leaving, hecause my host was one of the most remarkable men and most entertaining compauions I had ever met with. He was a Fleming by birth, and, like so many of his comitrymen, had a wonderful talent for languages. When quite a youth he had accompanied a Government official who was sent to report on the trade and commerce of the Mediterrancan, and had acquired the colloquial langrage of every place they stayed a few weeks at. He had alterwards made voyages to St. Petersburg, and to other parts of Europe, inchuding a few weeks in London, and had then come out to the East, where he had been for some years trading and speculating in the various islands. He now spuke Jutch, French, Malay, and Javanese, all equally well; English with a very slight accent, but with perfect fluency, and a most complete knowledge of idiom, in which I often tried to puzzle him in vain. German and Italian were also quite familiar to him, and his aequaintance with Euronuan languages included Momern Grenk, Turkish, Russian, aml collogual Hebrew and Latin. As a test of his pmwer, I may mention that he had made a foguge to the ont-of-theway jsland of Salibabon, and hat stayed there traliag a few weeks. As I was collecting vocabudaries, he tohl me loo throght he could remember sonne words, and dictated a considerable number. Some tinse after I met whit a
shant list of words taken down in thase jslands, and in every cate they agreed with those he had given me. He used to sing a Hebrew drinking-song, wheh he had learned from sume Jews with whom he had onee travellen, and astomished by joining in theil conversation, and had a never-enling fund of tale and ancedote abont the prople he had met and the places he had visited.

In most of the villages of this purt of Ceram are schools and native schoomasters, and the inhabitants lave heen long conserted to Christianity. In the larger villages there are Furopean missionaries; but there is little or no extermal difference between the Christian and Alfuro villages, nor, as far as 1 have seen, in their inhalitants. The people seon more decidedly Papuan than those of (iilulo. They are darker in colour, and a number of them have the frizaly Papuan hair; their features also are harsh and prominent, and the women in particular are far less cmagring than those of the Malay race. Captain Van der Beck was never tired of abusing the inhabitants of these Christian villages as thieves, liars, and drunkards, besides being incorrigilly lazy. In the city of Amboyna my friends Docturs Molanike and Doleschall, as well as most of the Luropean residents and traders, made exactly the same complaint, and would rather have Mahometans for servants, even if convicts, than any of the native Christians, One grat canse of this is the fact, that with the Mahometaus temperance is a part of their religion, and has become so much a habit that practically the role is never transgressed. One fertilo source of want, and one great incentive to idloness and crime, is thas present with the one class, but absent in the other, lant hesides this the Chris tians look upon themselves as nearly the equals of the Burumans, who profess the same religion, and as fiut superion to the followers of Islam, and are therefore prone to despise work, and to endeavon to live by trade, or by cultivatins their own land. It need hadly be said that with poople in this low state of civilization religion is almost wholly ceremonial, and that neither are the ductrines of Christianity comprelended, nor its moral precepts ubtyed. At the same time, as far as my own experitnce gors, I have found the better class of "Orang

Sirani" as civil, obliging, and industrious as the Malays, and only inferior to them from their tendency to get intoxicated.

Having written to the Assistant Resident of Saparua (who has juristiction over the opposite part of the coast of Ceram) for a boat to pursue my journey, I received one rather latger than necessary with a crew of twenty men, I therefore hade adieu to my kind friend Captain Van der Beck, and left on the evening after its arrival for the village of Elpiputi, which we reached in two days. I had intended is stay liere, but not liking the appearance of the place, which semed to have no virgin furest near it, 1 determined to proceed about twelve miles further up the bay of Amatay, to a village recently formed, and inhatited by indigenes from the faterior, and where some exteusive cacio plantations were being made by some gentlemen of Amboyna. I reached the place (called Awaiya) the same alternoon, and with the assistance of Mr. Peters (the manager of the plantations) and the native chief, oltained a small house, got all my things on shore. and paid and diseharged my twenty boatmen, two of whom had almot driven me to distraction by beating tom-toms the whole voyage.

I found the prople here very nearly in a state of nature, and gromg almost naked. The men wear their frizzly hair gathered into a flat circular knot over the left temple, which has a very knowing look, and in their ears cylinders of wool as thick as one's finger, and coloured red at the ends. Armlets and amklets of woven grass or of silver, with neeklaces of beals or of small fruits, complete their attire. The women wear similar ornaments, but have their hair loose. All are tall, with a dark brown skin, and well marked Fapuan pliysiognomy. There is an Amboynat schoolmaster in the village, and a good number of children attend school every morning. Such of the inhabitants as have become Chnistians may be known ly their weariug their hair loose, and aulopting to some oxtent the native Christian dress-irousers and a loose shirt. Very few speak Malay, all these coast villages having been recently formed by inducing natives to leave the inaccessible interior. "In all the central part of Ceram there now
remains only one populous village in the mountains. Towards the east and the extreme west are a finw others, with which exceptions all the inhabitants of Ceram are collected on the const. In the northern and eastern districts they are mustly Malometans, while on the southwest const, nearest Amboyna, they are nominal Christians.

In all this part of the Archipelagn, the Dutch make very praisewnthy offints to impowe the condition of the ahorigines by establishing schombasters in expry village (who are mostly natives of Ambeyna or Saparna, who have heen instrueted by the resident missionaries), and by emfoying native vacesatorx to prevent the ravages of smallpox. They alsh encompe the settement of Europeans, and the formation of new phatations of encao and coffee, one of the lest means of mising the comlition of the natives, who Chus obtain work at fair wages, and have the opportunity of acquiring something of European tastes and habits.

My condections here did not prouress much better than at my former station, xeept that buttertlies were a little more pleniful, and sone very line species were to be foumd in the monning on the sea-heach, sitting so quietly on the wet sand that thry could be caunht with the lingers. In this way I hat many line specimens of Papilios brought me by the chilltren. Beetles, luwever, were sarce, and Dirids still more so, ind 11 began to think that the handsome species which 1 han so often head were found in Ceram must le entirely confined to the eastern extremity of the island.

A fow miles further morth, at the head of the Bay of Amahay, is sithated the village of Makatiki, from whence there is a malive path quite across the island to the north cmast. My friend Mr. Rosenberg, whose atquantauce I had made at Now Guinea, and who was now the Govermment smerintendent of all this part of Ceran, returned from Wahai, on the north coast, after I had been three weeks at Awaya, and showet me some fine butterfles he had oldaned on the momatain streams in the interinns. Le indicated a spot about the centre of the islated where he thomber I might advantagenaly stay a few days. I accordingly visiteal Makariki with him the next day, and he instructed the chief of the village to
furnish tae with men to carry my baggage, and acconpany me on my excursion. As the people of the village wanted to be at home on Christmas-day, it was necessary to start as soon as possible; so we agreed tlat the men should be ready in two days, and I returned to make my arrangements.

I put up the smallest quantity of baggage possible for a six days' trip, and on the morning of December 18th we left Makariki, with six men carrying my baggage and their own provisions, and a lad from Awaiya, who was accustomed to eatch butterflies for me. My two Amboyma bunters I left behind to shoot and skin what birds they could while I was away. Quitting the willage, we first walked briskly for an hour through a dense tangled undergrowth, dripping wet from a storm of the previous night, and full of mud holes. After erossing several small streams we reached one of the largest rivers in Ceram, called Ruatan, which it was necessary to cross. It was both deep and rapid. The laggage was first taken over, parcel by parcel, on the men's heads, the water reaching nearly up to their armpits, and then two men returned to assist me. The water was above my waist, and so strong that I should certainly have been carried of my feet had I attempted to cross alone; and it was a matter of astonishment to me how the men could give me any assistance, since I foum the greatest difficulty in getting my foot down again when I had once moved it off the bottom. The greater strength and grasping power of their feet, from going always barefoot, no doubt gave them a surer footing in the rapid water.

Atter well wringing out our wet clothes and puttiag them on, we again proceeded along a similar narrow forest track as before, choked with rotten leaves and dead trees, and in the more open parts overgrown with tangled vegetation. Another hour brought us to a smaller stream flowing in a wide gravelly bed, up which our road lay. Here we stayed half an hou: to breakfast, and then went on, contiuually crossing the stream, or walking on its stony and gravelly banks, till about noon, when it became rocky and enelosed by low hills. A little further we entered a regular mountain-gorge, and had to
clamber over rocks, and every moment cross and recross the water, or take short cuts through the forest. This was fatiguing work; and about three in the afternoon, the sky being overeast, and thunder in the mountains indicating an approaching storm, we had to look out for a camping place, and soon after reached one of Mr. Rosenberg's old ones. The skeleton of his little sleeping-hut remained. and my men eut leaves and made a hasty rool just as the rain commenced. The baggage was covered over with leaves, and the men sheltered themselves as they could till the storm was over, by which time a flood came down the river, which effectually stopped our further mareh, even had we wished to proceed. We then lighted fires; I made some coffee, and my men roasted their fish and plantains, and as soon as it was dark, we made ourselves comfortable for the night.

Starting at six the next morning, we had three hours of the same kind of walking, during which we crossed the river at least thirty or forty times, the water being generally knee-deep. This brought us to a place where the road left the stream, and here we stopped to breakfast. We then had a long walk over the mountain, by a tolerable path, which reached an elevation of about filteen humdred feet above the sea. Here I noticed one of the smallest and most elegant tree ferns 1 had ever seen, the stem being scarcely thicker than my thumb, yet reaching a height of fifteen or twenty feet. I also caught a new butterily of the genus Pieris, and a magnificent female specimen of Papilio gambrisins, of which I had hitherto ouly found the males, which are smaller and very different in colour. Descending the other side of the ridge, by a very steep path, we reached another river at a spot which is about the centre of the isłand, and which was to be our resting-place for two or three days. In a conple of hours my men had built a little sleeping-shed for me, about eight feet by four, with a bench of split poles, they themselves occupying two or three smaller ones, which had been put up by former passengers.

The river liere was about twenty yards wide, running over a pebbly and sometimes a rocky bed, and bordered by steep hills with occasionally flat swampy spots be-
tween their base and the stream. The whole country was one dense, mobroken, aud very damp and gloomy virgin forest. Tust at our resting-place there was a little bush-covered island in the middle of the chanmel, so that the opening in the forest made by the river was wider than usual, and allowed a few gleams of sunshine to penetrate. Here there were several handsome butterlies Hying about, the finest of which, howevor, escaped me, and I mever saw it again during my stay. In the two days and a half which we remained bere, I wandered almost all day tp and down the stream, searching after butterflies, of which I got, in all, fifty or sixty specimens, with several species quite new to me. There were many others which I saw only once, and did not capture, causing me to regret that there was no village in these interior valleys where I could stay a month. In the early part of each morning I went out with my gun in search ol birds and two of my men were out almost all day after deer: out we srere all equally unsuccessful, getting absolutely nothing the whole time we were in the forest. The only good bird seen wis the fine Amboynn lory, but these were always too high to shoot; besides this, the great Moluccan hornbill, which I did not want, was almost the only bird met with. I saw not a single groundthrush, or kingfisher, or pigeon; and, in fact, have never been in a forest so utterly desert of animal life as this appeared to be Even in all other gronps of insects, except butterfies, there was the same poverty. I had hoped to find some rave tiger beetles, as I had done in similar situations in Celebes; but, though I searched closely in forest, river-bed, and mountain-brook, I conld find nothing but the two common Amboyua species. Other beetles there were absolutely none.

The constant walking in water, and over rocks and pebbles, quite destroyel the two pair of shoes I brought with me, so that, on my return, they actually fell to pieces, and the last day I had to walk in my stockings very painfully, and reached home quite lame. On our way back from Makariki, as on our way there, we had storm and rain at sea, and we arrived at Awaiya late in the evening, with all our baggage drenched, and ourselves
thoroughly uncomfortable. All the time I had been ma Ceran I had suffered much from the irritativg bites of :n risible inacarus, which is worse than mosquitoes, ants, and every other pest, because it is impossible to gnand against them. This last journey in the lorest beft mes covered fromz head to foot with indlmed lumps, which, after my return to Amboynas prolnced a serious disease, contining me to the holse for nearly two months,- a not very pleasant menento of my tirst visit to Ceram, which terminated with the year 1859 .

It was not till the 24 th of lebuary, 1860 , that I started again, imtending to pass from village to village along the coast, staying where I fomul a suitable docality. I had a letter from the Govermor of the Moluceas, requesting all the chiefs to supply mo with bats and men to earry me on my jouncy. The liest buat took ane in two days to Amalay, on the opposite side of the bay to Awaya. The chief here, wonderful to relate, did not make any excuses for delay, but inmediately ondered out the boat which was to carry me on, put ruy baggage on hoard, set up mast and sails atter dark, and bad the men ready that night; so that we were actually on our way at dive the next morning,-a display of energy and activity I searcely ever satw before in a native chicf on such an occasion. We tonched at Cepa, and stayed for the night at Tamilan, the first two Mahometan villages on the south coast of Ceram. The next day, alont noon, we reached Hoya, which was as far as my present loat and crew were going to take me. The auchorage is about a mile east of the village, which is faced by coral reefs, and we had to wait for the evening tide to nove up and anload the bat into the strange rotten wooden pavilion kept for visitors.
There was no boal here large enough to take my hagage ; and although two would have done very well. the lajah insisted upon sending four. The reason of this 1 found was, that there were four swall villages under his rule, and by sending a boat from cach he would avoid the difficult task of choosing two and letting off the others. I was told that at the next village of Tuluti there were plenty of Alfures, and that I could get abundauce of lories and other hivels. The Rajali declared that black and yellow
lories and black cockatoos were found there; but I an inclined to think he knew very well lre was telling me lies, and that it was only a scheme to satisfy me with his plan of taking me to that village, instend of a day"s journey further on, as I desired. Here, as at most of the villages, I was asked for spirits, the people being mere nominal Mahometans, who emfine their religion almost entirely to a discust at pork, and a few other forbidden articles of food. The next morning, after much trouble, we got our cargoes Joaded, and had a delightulul row across the deep bay of Teluti, with a view of the gramd cental mountain-mane of Ceram. Our four boats were rowed ly sixty mell, with dhas llying and tom-toms beating, as well as very vigorous shouting and singing to keep up their spivits. The sea was suooth, the moming loright, ant the whole scene very exhilatating. On landing, the Orang-kaya and several of the chief men, in gorgeons silk jackets, were waiting to receive us, and conducted me to a house prepared for my reception, where I determined to stay a few days, and see if the country round produced anything new.

My first inquities were about the lories, but I could get very little satisfactory information. The only kinds known were the ring-necked lony and the common rod and green lorikect, both common at Amboyna. Black lories and "ockatoos were quita mannown. The Alfuros resided in the mountains five or six tlays' journey away, and there were only one or two live hiris to be found in the village, and these were worthless, My hunters eonld get nothing but a few common lirds ; and notwithstanding fine monntains, Inxuriant forests, and a locality a lundred miles castwam, I cond fime no new insects, and extrenely few even of the mommon species of Amboyna and West Ceran. It was evidently no use stopping at such a place, and I was determined to move on as soon as possible.

The village of Teluti is populous, but strageling and very dirty. Sago trees here cover the momutain side, instead of growing as usuad in low swamps ; but a closer examiwation shows that they grow in swampy patches, which have formed amoner the loose rocks that cover the cround, and which are kept constantly full of monsture by the rains, and by the abundance of rills which trickle down amoug thom.

This sago forms almost the whole subsistence of the inlabitants, who appear to cultivate nothing but a few smail patches of maize and sweet potatoes. Hence, as before explained, the scarcity of insects. The Orang-kaya has fine elothes, landsome lamps, and other expensive European goouls, yet lives every day on sago and fish as miserably as the rest.

After three alays in this baren place I left on the morning of March 6th, in two boats of the same size as those which had brought me to Teluti. With some difficulty 1 had obtained permission to take these boats on to Tobo, where I inteuded to stay a while, and therefore got on protty quickly, changing men at the village of Laiemu, and arriving in a heavy rain at Alhtiago. As there was a good deal of surf here, and likely to be more if the wind blew hard during the night, our boats were pulled up on the beach; and after supping at the Orang-kaya's house, and writing down a vocabulary of the language of the Alfuros, who live in the mountains inland, I returned to sleep in the boat. Next morning we procceded, clanging men at Warenama, and again at Hatometen, at both of which places there was much surf and no harbour, so that the men had to go on shore and come on board by swinming. Arriving in the evening of March 7th at Batuassa, the first village belonging to the Rajah of Tobo, and under the government of Banda, the surf was very leavy, owing to a strong westward swell. We therefore rounded the rocky point on which the village was situated, but found it very little better on the other side. We were obliged, however, to go on shore here; and waiting till the people on the beach had made prepuations, by placing a row of logs from the water's ellge on which to pull up our boats, we rowed as quickly as we could straight on to them, after watching till the heaviest surfs had passed. The moment we touched ground our men all jumped out, nnd, assisted by those on shore, attempted to haul up the hoat high and dry, but not having sufficient hands, the surf repeatedly broke into the stern. The steepness of the beach, however, prevented any damage leing done, and the other boat having both crews to haul at it, was got up without difficulty.

The next morning, the water being low, the breakers
were at some distance from slore, and we had to watels for a smooth moment after bringing the boats to the water's edge, and so got safely out to sea. At the two next villages, Tobo and Ossong, we also took in fresh men, who came swimming through the surf ; and at the latter place the Rajah came on hoand and acompanied me to Kissalant, where he has a house which he lent me during my stay. Here again was a hervy surf, and it was with great difficulty we grot the boats saffly hauled up, At Amboyna l had been promised at this season a calm seatal the wind off shore, but in this case, as in every other, I had been unable to obtain any reliable information as to the winds and seasons of haces distant two or three days' journey. It appears, however, that owing to the general direction of the island of Cetam (E.S.E. and W.N.W.), there is a heavy surf and searedy any shelter on the south coast during the west monsoon, when alone a jounney to the eastward can be safely made; while during the ast monsoon, when I proposed $t_{t}$ return along the north coast to Wahai, I shoukd probably timd that equally exposed and dangerous. Ihut althongh the general direction of the west monsoon in the Banda sea causes a henvy swell, with had surf on the coast, yet we had little advantage of the wind ; for, owing I suppose to the mumerous bays and headlands, we had contrary south-east or even due east winds all the way, and had to make almost the whole distance from Amboyna by foree of rowing. We lad therefore all the disadvantages, and none of the advantages, of this west monsoon, which I was told would insure me a quick and pleasant journey.

I was delayed at Kissa-laut just four weeks, althought after the first three days 1 saw that it would be quite useless for me to stay, and begged the Rajah to give me a prau and men to carry me on to Coram. But instead of getting one close at land, he insisted on sending several miles off; and when alter many delays it at length arrived, it was altogether unsuitable and too small to carry my baggage. Another was then ordered to be brought immediately, and was promised in three doys, but double that time elapsed and none appeared, and we were obliged at length to get one at the aljoining village, where it might have been so much more easily obtained at first. Then came caulking
and covering over, and quarrels between the owner and the Tajah's men, which occupied more than another ten days, during all which time I was getting absolutely nothing, finding this part of Ceram a perfect desert in zoology, although a most beautiful country, and with a very luxuriant vegetation. It was a complete puzzle, which to this day I have not been ahle to unlerstaud ; the only thing I obtained worth notice during my month's stay here being a few good land shells.

At length, on $A_{p}$ ril 4 th, we succeded in getting anway in our little boat of about four tons burthen, in whichs my numerous boxes were with difliculty packed so as to leave slepping and cooking rom. The craft could not boast an once of irnm or a liot of rope in any part of its construetion, nor a morsel of pitel or paint in its decoration. The planks were fastened together in the usual ingenious way with pers and rattans. The mast was a bambo triangle, requiring no shrouds, and carrying a long mat sail; two rulders were hung on the quarters by rattans, the anchor was of wook, and a long and thick rattan served as a cahle. Our crew consisted of four men, whose sole accommodation was about three feet by four in the bows and stem, wilh the sheping thatch roof to stretch themselves upor for a change. We had nearly a hundred miles to go, fully exprosed to the swell of the banda sea, which is sometimes very considerable; but we luckily had it calm and smooth, so that we made the vogage in comparative comfort.

On the second day we passed the castern extremity of Ceram, formed of a mroup of hummocky limestone hills; and, sailing by the islands of Kwamer and Kefling, beth thickly inhabited, cane in sight of the Jittie town of Kilwarn, which appears to rise out of the sea like a rustic Venice. This place hats really a most extraordinary appearance, as not a particle of land or vegetation can he seen, but a long way out at sea a large village seme to Hoat upon the water: There is of course a smatl ishand of several acres in cxtent; but the houses are built so closely atl round it upon piles in the water, that it is completely hidden. It is a phate of great tradtic, being the emporimn for much of the produce of these Eastern seas, and is the
residence of many Bugis and Ceramese tralers, and appears to have been chosen ou account of its being close to the only deep chanel between the extensive shoals of Ceramlaut and those bordering the east end of Ceram. We now had contrary east winls, and were obliged to pole over the shallow coral reefs of Ceram-laut for nearly thirty miles. The only danger of our voyage was just at its termination, for as we were rowing towards Manowolko, the largest of the Goram group, we were carried out so rapilly by a strong westerly current, that I was almost certain at one time we should pass clear of the island: in which case our situation would have been both disarreeable and dangerous, as, with the east wind which had just set in, we might have buen unable to return for many days, and we had not a day's water on board. At the eritical monent I served out some strong spirits to my men, which put fresh vigour into their arms, and carried us out of the influence of the current before it was too late.

## MANOWOLKO, GORAM GROUP.

On arriving at Manowolko, we found the Rajah was at the opposite island of Goram; but he was immediately sent for, and in the meantime a large shed was given for our accommodation. At might the Rajah came, and the next day I had a visit from him, and found, as I expected, that I had already made his acquaintance three years before at Aru. He was very friendly, and we lad a long talk; lut when I berged for a boat and men to take me on to ké, he made a lost of diffeculties. There were no praus, as all had gone to Ké or Aru; and even if oue were found, there were no men, as it was the season when all were away trading. But he promised to see about it, and I was obliged to wait. For the next two or three days there was more talking and more difficulties were raised, and I had time to make an examination of the island and the people.

Manowolko is about fifteen miles long, and is a mere upraised comal-reef. Two or three hundred yards inland rise cliffs of coral rock, in many parts perpendicular, and one or two hundred feet high; and this, I was informed, is characteristic of the whole island, in which there is

no other kind of rock, and no stream of water: A few cracks and chasms furnish paths to the top of these cliffs, where there is an opeu undulating country, in which the chief vegetable grounds of the inhabitants are situated.

The people here-at least the chicf men-were of a much purer Malay race than the Mahometans of the manand of Ceram, which is perhaps due to there haviug been no indigenes on these small islauds when the first settlers arrived. In Ceram, the Alfuros of Papuan race are the predominant type, the Malay physiognomy being seldom well marked; whereas here the reverse is the case, and a slight infusion of Papuan on a mixture of Malay and Bugis has produced a very good-looking set of people. The lower class of the population consists almost entively of the jndigenes of the adjacent islands. They are a fine race, with strongly-marked Papuan features, frizzly hair, and brown complexions. The Goram language is spoken also at the east end of Cemm, and in the adjacent islands. It has a general resemblance to the lauguages of Ceram, but possesses a peculiar clement which I have not met with in other languages of the Archipelago.

After great delay, considering the importance of every day at this time of year, a miserable boat and five men were found, and with some difficulty I stowed away in it such baggage as it was absolutely necessary for me to take, leaving scarcely sitting or sleeping room. The sailing qualities of the boat were highly vaunted, and 1 was assured that at this season a small one was much more likely to succeed in making the journey. We first coasted along the island, reaching its eastern extremity the following moming (April 11th), and found a strong W.S.W. wind howing, which just allowed us to lay across to the Matabello Islands, a distance little short of twenty miles. I did not much like the look of the heavy sky and rather rough sea, and my men were very unwilling to make the attempt; thut as we could scarcely hope for a better chance, 1 insisted upon trying. The pitching and jerking of our little boat suon reduced me to a state of miserable helplessness, and I lay down, resigned to whatever might happen. After three or four hours, I was told we were nearly over; but
when I got up, two hours later, just as the sun was setting, I found wo were still a grod distance from the point, owing to a strong current which had been fir some time against us. Night closed in, and the wind drew mere ahead, so we lrad to take in sail. Then came a caln, and we rowed and sailed as oceasion offered ; and it was four in the morning when we reached the village of $K$ issiwoi, not having made more than three miles in the last twelve houts.

## Matalello ISLands.

At daylight I found we were in a beatiful little harbonr, formed ly a coral reet about two hundred yards from shore, and perfectly secure in every wind. Having eaten mothing since the previous moming, we cooked our bratstast comfortably on shore, and left about noon, masting along the two islands of this group, which lie in the same line, and are separated hy a narrow channel. both samin entively fomed of ratsed comal rook; but there has been a subsequent subsidence, as shown by the barmer red which extombs all alone then at varying dixtances from the shore. This recf is sometimes only marked by a line of breakers when there is a little swell on the sea; in other places there is a ridge of dead coral ahowe the water, which is here and there high enongh to support a tew low bushes. This was the first example I had met with ol a true barrier reef due to subsidence, as has been so clearly shown by Mr. Darwin. In a sheltered archipelago they will soldom be distinguishable, from the absence of those hure rolling waves and breakers which in the wide ocean throw up a barrier of broken coral far above the usual high-water mark, while here they rarely rise to the surface.

On reaching the end of the southern island, ealled Uta, we were kup waiting two days for a wind that would cuable us to pass over to the next island, Tcor, and I began to despair of ever reaching Ké, and deternined on returning. We left with a south wind, which suddenly changed to morth-east, and induced me to turn again soutbward in the hopes that this was the commencement of a few days' favourable weather. We sailed on very
well in the rirection of Teor for abont an hour, after which the winl shifted to W.S.W., and we were driven much chat of our course, and at nightfall found oursolves in the open sea, and full ten miles to leeward of our deatimation. My men were now all very mueh frightened, for if we went on we might be a week at sea in our litte open boat, laden almost to the water's edge; or we might drilt on to the eoast of New Gininea, in which casp we should most likely all be murdered. I could not deuy these probabilities, and althongh I showed them that we could not get back to our stating-point with the wind as it was, they insisted apon retuming. We accordingly put about, and found that we could lay no nearer to Utib than to 'Tem' ; however, by great good luck, about ten o'clock we hit upon a little coral island, and hay under its lee till morning, when a favourable change of wind brought us back to Uta, and by eveniug (April 18 th) we reached our first anchorage in Matahello, where I resolved to stay a few days, and then return to Guram. It was with much regret that I gave up ny trip to Ke and the intervening islands, which I had lowed forward to as likely to make up for my disappoinment in Ceman, since my short visit on my voyage to Aru hat proluced me so many rare and beatiful insects.

The natives of Matabello are almost entirely occupied in making cocon-mut oil, which they sell to the Dogis and Goram traders, who carry it to Bauda and Amboyna, The rugged coral rock seems very favourable to the growth of the cocoa-nut palm, which abounds over the whole island to the very highest points, and produces fruit all the year round. Along with it are great numbers of the area or betel-nut palon, the muts of which are sliced, dried, and ground into a paste, which is much used by the betelchewing Malays and Papuns. All the little children here, even such as can just run alone, cartied between their lips a mass of the nasty-lowking red priste, which is even more disynsting than to see them at the same age smoking cigars, which is very common even before they are weaned. Cocoa-nuts, sweet protatoes, an ocensiomal saco cake, and the refuse nut alter the oil has been extracted by boiling, form the chicf sustenance of these people; and the effect
of this poor and unwholesome diet is seen in the frequency of eruptions and scurly skin diseases, and the nusterous sores that disfigure the faces of the children.

The villages are situated on hinh and rugged coral peaks, only accessible by steep narrow paths, with ladders and bridges over yawning clasms. They are filthy with rotten husks and oil refuse, and the huts are dark, greasy, and dirty in the extreme. The people are wretched ugly dirty savages, chothed in unchanged rags, and living in the most miseraldu maner, and as every trop of tresh water has to be brought up, from the beach, washing is never thought of; yet thoy are actually wealthy, and have the means of purchasing all the necessaries and luxuries of life. Fowls are abmudant, and eggs were given me whenever I visited the villages, but these are never eaten, being looked upon as pets or as merchandise. Almost all of the women wear massive gold marings, and in every village there are dozens of small hronze cannon lying about on the ground, although they have cost on the average perhaps $10 l$. apiece. The chide men of each village cane to visit me, plothed in rohes of silk and Howerel satio, though their houses and their daily fure are no better than those of the other inhabitants. What a contrast hetween these people and such savages as the best tribes of hill Dyaks in Borneo, or the Indians of the Uaupes in South America, living on the banks of clear streams, clean in their persons and their houses, with abundance of wholesome food, and exhibiting its effect in healtly skins and leanty of form and feature! There is in fact almost as much difference between the various races of savage as of civilized peoples, and we may safely affirm that the better specimens of the former are much superior to the lower examples of the latter class.

One of the few luxuries of Matabollo is the palm wine, which is the fermented sap from the hower stems of the cocos-nut. It is really a very nice drink, more like cyder than beer, though quite as intoxicating as the latter. Young encoa-nuts are also very abundant, so that anywhere in the island it is only necessary to go a few yards to find a delicious beverage by elimbing up a tree for it. It is the water of the young fruit that is drunk, before the
pulp has hardened; it is then more abundant, clear, and refreshing, and the thin coating of gelatinous pulp is thought a great luxury. The water of full-grown cocoanuts is always thrown away as undrinkable, although it is delicious in comparison with that of the old dry nuts which alone we obtain in this country. The cocoa-nut pulp I did not like at first; but fruits are so searee, except at particular seasons, that one soon learns to appreciate anything of a fruity nature.

Many persons in Europe are under the impression that fruits of delicious flavour abound in the tropical forests, and they will no doubt be surprised to learn that the truly wild fruits of this grand and luxuriant archipelago, the vegetation of which will vie with that of any part of the world, are in almost every island inferior in abundance and quality to those of Britain. Wild strawberries and raspberries are found in some places, but they are such poor tasteless things as to be hardly worth eating, and there is nothing to compare with our blackberries and whortleberries. The kanary-nut may be considered equal to a lazel-nut, but I have met with nothing else superior to our crals, our haws, beech-nuts, wild plums, and acorns; fruits which would be highly estecmed by the natives of these islands, and would form an important part of their sustenance. All the fine tropical fruits are as much cultivated productions as our apples, peaches, and plums, and their wild prototypes, when found, are generully either tasteless or uneatable.

The people of Matabello, like those of most of the Mahometan villages of East Ceram and Goram, amused me much by their strange ideas concerning the Russian war. They believe that the Russians were not only most thoroughly beaten by the Turks, but were absolutely conquered, and all converted to Islamism! And they can hardly be convinced that such is not the case, and that had it not been for the assistance of France and England, the poor Sultan would have fared ill. Another of their notions is, that the Turks are the largest and strongest people in the world-in fact a mace of giants; that they eat enormons quautities of meat, and are a most ferocious and irresistible nation. Whence such strangely incorrect
opinions could have arisen it is difficult to understand, unless they are derived from Arab priests, or hadjis returned from Mecea, who may have heard of the ancient prowess of the Turkish armies when they made all Europe tremble, and suppose that their character and warlike capacity must be the same at the present time.

## GOLAM.

A stendy south-east wind having set in, we returned to Manowolko on the 25 th of April, and the day after crossed over to Ondor, the chief village of Goram.

Around this island extends, with few interruptions, an encircling coral reef about a quarter of a mile from the shore, visible as a stripe of pale green water, but only at very lowest ebb-tides showing any rock above the surface. There are several deep entrances through this reef, and inside it there is good anchorage in all weathers. The land rises gradually to a moderate height, and numerous small streams descend on all sides. The mere existence of these streams would prove that the island was not entirely coralline, as in that case all the water would sink through the porous rock as it does at Manowolko and Matabello ; but we have more positive proof in the pebbles and stones of their beds, which exhibit a variety of stratified erystalline roeks. About a hundred yards from the beach rises a wall of coral rock, ten or twenty feet high, above which is an undulating surface of rugged coral, which slones downwarl towards the interior, and then after a slight ascent is bounded by a second wall of coral. Similar walls occur higher up, and coral is found on the highest part of the island.

This peculiar structure teaches us that before the coral was formed land existed in this spot; that this land sunk gradually beneath the waters, but with intervals of rest, during which encircling reeffs were formed around it at different elevations; that it then rose to above its present elevation, and is now again sinking. We infer this, because encircling reefs are a proof of subsidence; and if the island were again elevated about a hundred feet, what is now the reef aud the shallow
sea within it would form a wall of coral rock, and an umblating coralline phain, exactly similar to those that still exist at various altitudes up to the summit of the island. We learn also that these changes have taken place at a comparatively recent epoch, for the surface of the coral has scarcely suffered from the action of the weather, and hundreds of sea-shells, exactly resembling those still found upon the beach, and many of them retaining their gloss and even their colons, are seatered over the surface of the island to near its summit.

Whether the Goram group formed originally part of New Guinea or of Ceram it is searecly pussible to determine, and its proluctions will throw little light upon the question, if, as I suppose, the islands have been entirely submerged within the epoch of existing species of animats, as in that case it must owe its present fauna and thora to recent immigration from surrounding lands; and with this view its poverty in species very well agrees. It possesses much in common with East Ceram, but at the same time has a grood deal of resemblance to the Ké Islands and landa. The fine pigeon, Corpophagn conciuna, inhabits Fé, Banda, Matabello, and Goram, ani is replaced by a distinct species, C. neylecta, in Ceram. The insects of these four islands have also a common facies-facts which scen to indicate that some more extensive land has recently disappeared from the area they now occupy, and has supplied them with is few of its peculiar $\mathrm{p}^{\text {ro- }}$ ductions.

The Goram people (anong whom I stayed a month) are a race of traders. Every year they visit the Tenimber, Ké, and Aru Islands, the whole north-west const of New Guinea from Oetanata to Salwatty, and the islands of Watgiou and Mysol. They also extend their voyages to Tidore and Ternate, as well as to Banda and Amboyna. Their praus are all made by that wonderful race of boatbuilders, the Ké islanders, who annually turn out sone hundreds of boats, large and small, which can hardly be surpassed for beauty of form and goodness of workmanship. They trade chiefly in tripang, the medicinal mussoi bark, wild nutmergs, and tortoise-shell, which they sell to the Bugis traders at C'ram-laut or Aru, few of them saring to
take their products to any other market. In other respects they are a lazy race, living very poorly, and much given to opium smoking. The only native manufactures are sailmattisy, coarse cotton cloth, and paudanus-leaf boxes, prettily stained and ornamented with shell-work.

In the island of Goram, only eight or ten miles long, there are about a dozen Rajahs, scarcely better off than the rest of the inhabitiants, and exercising a mere nominal sway, except when any order is received from the Dutch Government, when, being backed by a higher power, they show a little more strict authority, My friend the Rajah of Ammer (commouly called Rajah of Goram) told me that a few years aro, before the Dutch had interfered in the aflairs of the island, the trade was not carried on so peaceably as at present, rival prass often fighting when on the way to the same locality, or traflicking in the same village. Now such a thing is never thought of-one of the good effects of the superintendence of a civilized government. Disputes hetween villages are still, however, sometimes settled by fighting, and I one day saw about fifty men, carrying long guns and heavy cartridge-belts, march through the village. They had come from the other side of the island on some question of trespass or boundary, and were prepared for war if peaceable nerotiations should fail.

While at Manowolko I had purchased for 100 florins (9t.) a small prau, which was brought over the next day, as I was informed it was more easy to have the necessary alterations made in Gorm, where several Ké workmen were settled.

As soon as we began getting my pran ready I was obliged to give up collecting, as I found that unless I was constantly on the spot myself very little work would be done. As I propesed making some long voyages in this boat, I determinel to fit it up convenicntly, and was obliged to do all the inside work myscli, assisted by my two Arahoynese hoys. I had plenty of visitors, surprised to see a white man at work, and much astonished at the novel arrangements I was making in one of their native vessels. Luckily 1 had a few touls of my own, incluming a small saw and sume chisels, and these were now severely
tried, cutting and fitting heavy iron-wood planks for the flooring and the posts that support the triangular mast. Being of the best London make, they stood the work well, and without them it would have been impossible for me to have finished my boat with half the neatness, or in double the time. I had a Ké workman to put in new ribs, for which I bought nails of a Bugis traler, at $8 d$, a pound. My gimlets were, however, too small; and having no augers we were obliged to bore all the holes with hot irons, a most tedious and unsatisfactory operation.

Five men had engaged to work at the pran till finished, and then go with me to Mysol, Waigiou, and Ternate. Their idens of work were, however, very different from mine, and I had immense difficulty with them; sehdom more than two or three coming together, and a humdred excuses being given for working only hall a day when they did come. Yet they were constantly begring alvances of money, saying they lad nothing to eat. When I gave it them they were sure to stay away the next day, and when I refused any further advances some of them declined working any more. As the boat appronched completion my dificulties with the men increased. The uncle of one had commenced a war, or sort of faction fight, and wanted his assistance; another's wife was ill, and would not let him come; a third had fever and ague, and pains in his head and back; and a fourth had an inexorable creditor who would not let him go out of his sight. They had all received a month's wages in advance; and though the amount was not large, it was necessary to make them pay it lack, or I should get no men at all. I therefore sent the village constable after two, and kept them in custody a day, when they returned about three-fourths of what they owed me. 'The sick man also paid, and the steersman found a substitute who was willing to take his debt, and receive ouly the balance of his wages.

About this time we had a striking proof of the dangers of New Guinea trading. Six men arrived at the village in a small boat almost starved, having escaped out of two praus, the remainder of whose crews (fourteen in number) had been murdered by the natives of New Guinea. The praus had left this village a few months before, and among.
the murdered men were the Rajalis son, and the relations or slaves of many of the inhabitants. The ery of lamentation that anose when the news arrived was most distressing. A score of womm, who had lost lasbands, brothers, sons, or more distant relatives, set up at once the most dismal shrieks and groans and wailings, which contimed at intervals till litte at night; and as the chief lootses in the village were crowded torgther rond that which I ocenpied, onr situation was anything but agreable.

It seems that the village where the attack took place (nearly opposite the small ishaud of Lakahia) is known to tre dangerons, and the vessels hat only gone thene a few days belore to buy sone tripang. The crew were living on shore, the prans beime in a small river cluse by, and they were attacked and mumered in the day-time while largaining with the Papmans. The six men who survived were on board the prans, and escaped by at once getting into the small boat and rowing out to sea.

This south-west part of New Guima, known to the native trulers as " Tapua Kowiye" and "I apua Onen," is inhabited hy the most treatherous and bloodthirsty trihes. It is iu these distriets that the emmanders and portions of the crews of many of the enrly discovery ships were murdered, and sarcely a year now prases lut some lives are lost. The Gomm and Ceram traders are themselves generally inoftensive; they are well acfuaintal with the character of these matives, and are not likely to provoke an attack by any insults or open attempt at mhinery or imposition. They are accustomed to visit the same phaces every year, and the matives can have no far of 1 lom, as may be alleged in excuse for their attacks on Euronems. In other extensive districts inhabited by the same Papuan races, such as Mysol, Salwatty, Wagion, and some parts of the adjacent const, the people have taken the first step in civilization, owing polnbly to the settement of traders of mixed breed anong then, and for many years no such attacks have taken phace. On the south-west coast, and in the large island of Johie, however, the matives are in a very barbarous connlition, and take every opportunity of robbery nad murder,-a habit which is confirmed by the impunty
they experience, owing to the vast extent of wild mountain and forest country forbidling all pusuit or attempt at punishment. In the very sme village, four years before, more than fifty Goram men were murdered; and as these savares obtain an immense booty in the praus and all their appurtemaness, it is to be feared that such attacks will continue to be wade at intervals as loug as traders visit the same spots and attempt no retaliation. Punishment conld only be indicted on these people by very arbitrary measures, such as by obtaining possession of some of the chiefs by stratagem, and rendering them responsible for the capture of the murderers at the peril of their own heads. But anything of this kime would he quite contrary to the system adopted by the Dutch Government in its dealings with matives.

## GORAM TO WAIA IN CELRAM.

When my boat was at length lamehed and loaded, I rot my men torether, and actually set sail the next day Mity $27 \mathrm{th})$, much to the astomishment of the Goram people, to whon such punctuality was a novelty. 1 had at crew of three men and a bey, besides my two Amboyna lads; which was suffieient for sailing, though rather too few if obliged to row much. The next day was very wet, with squalls, calans, and contray winds, and with sone dilliculty we reached Kilwaru, the metropolis of the Bugis iraders in the far East. As I wanted to make some purchases, I stayed here two days, and sent two of my loxes of specimens ly a Macassar pran to be furwarded to Ternate, thus relieving myself of a considerable incumbrance. I bought knives, basins, and handkerchieds for barter, which with the choppers, cloth, and beads I had brought with me, made a pretty good assurtment. I also bought two tower muskets to satisify my crew, who insisted on the necessity of being armed arainst attacks of pirates; and with spices and a few articles of food for the voyage nearly my last doit was expended.

The litte island of Kilwarn is a mere sandbank, just large enough to contain a small village, and situated between the ishonds of Ceram-dat, and Kissa-straits abont
o third of a mile wide separating it fron each of them. It is surrounded ly coral rects, and offers goon anchotage in both monsoons. Though not more than filty yards across, and not clevated nome than three or fone feet above the highest tides, it has wells of excellent drinking watera singular phenomenon, which would seem to imply deepseated subterranean channels commecting it with other jslands. These manantares, with its situation in the centre of tle Papuan trating district, lead to its being so much frequented by the Rugis traders. Hore the Goram men bring the produce of their little voyages, which they exchange for cloth, sago cakes, and opium ; and the ishalitants of all the surrounding islands visit it with the same object. It is the renleavous of the praus trading to various jarts of New Gninea, which here assort and dry their cagoes, and refit for the voyage home. Tripang and nussoi bark are the most bulky articles of produce brought here, with wild nutmegs, tortoise-shell, pearls, and birds of laradise, in smaller quantities. The villagers of the mainland of Ceram bring their saso, which is thus distributed to the ishats farther east, while rice from Mali and Macassar ean also be purchased at a moderate price. The Goram men come here for their supplies of opium, both for their own consumption ant for harter in Mysol and Wagion, where they have introntuced it, and where the chiefs and wealthy men are passionately fond of it. Schooners from Bali come to buy lapuan slaves, while the sen-wandering Bugis arrive from distant Singapore in their lumbering praus, lringing thence the produce of the Chinamen's workshops and Kling's hazaar, as well as of the looms of Lancashire and Massachusetts.

One of the Bugis traders who had arrived a few days before from Mysol, brought me news of my assistant Charles Allen, with whom he was well aequainted, and who, he assured me, was making large collections of birds and insects, althongh he had not oltained any birds of Paradise; Silinta, where he was staying, not being a good place for them. 'Ihis was on the whole satisfactory, and I was anxious to reach him as soon as possible.

Jeaving Kilwaru early in the morning of June 1st, with a strong east wind we doubled the point of Ceram about
noon, the heavy sea cansing my prau to roll ahout a good deal, to the damage of our crockery. As bad weather seemed coning on, we got inside the reefs and anchored opposite the village of Warus-warus to wait for a change. The night was very squally, and though in a good harbour we rolled and jerked uneasily; but in the morning I had greater cause for uneasiness in the discovery that our entive Goram crew had decamped, taking with them all they possessed and a little more, and leaving us without any small boat in which to land. I immerliately told my Amboyna inen to load and fire the muskets as n simnal of distress, which was soon answered by the village chicf sending off a boat, which touk me on shore. I requested that messengers should be immediately sent to the neighbouring villages in quest of the fugitives, which was promptly done. My prau was brought into a small creek, where it could securely rest in the mud at low water, and part of a house was given me in which I could stay for a while. I now found my progress again suddenly checked, just when I thought I had overcome my chief difficulties. As I had treated my men with the greatest kindness, and had given them almost everything they had asked for, I can impute their rumning away only to their being totally unaccustomed to the restraint of a Limropenn master, and to some madefined dread of my ultimate intentions regarding them. The oldest man was in opium smoker, and a reputed thief, but I had been obliged to take him at the last moment as a substitute for another. I feel sure it was he who induced the others to run away, and as they knew the country well, and had several hours' start of us, there was little chance of catching them.

We were liere in the great sago district of East Ceram, which supplies most of the surrounding islands with their daily bread, and during our week's delay I had an opportunity of seeing the whole process of making it, aud obtaining some interesting statistics. The sago tree is a palm, thicker and larger than the cocon-mut tree, although rarely so tall, and laving immense pinnate spiny leaves, which completely cover the trunk till it is many years old. It has a creeping root-stem like the Nipa palm, and when about ten or fifteen years of age sends up an immense
termina? spike of fownes, alter which the tree dies. It grows in swathps. He in swampy hotlows on the romy slopes of hills, where it seems to thrive equally well a: when exposed to the inllus of sall or buckich water. The midribs of the inmense luaves fum one of the most useful articles in these lands, supplying the puce of hamboo, to which for many purposes they are sun rion. They are twelve or fifteen feet long, and, when very finc, as thick in the lower part as a man's leg. They are very light, consisting entirely of a firm pith covered with a haril $^{\text {ith }}$ thin rind or bark. Entire houses are built of these; thoy form admiable roofing-poles for thateh; split and wellsupported, they do for hooring ; and when chosen of etual size and perged togrether sinte by sile to fill up the panels of franed wooden louses, they lave a very neat apmearance, and make better walls and partitions than boards, as they do not shrink, require no paint or varnish, and are not a quarter the expense. Whon carefully split and shaved smouth they are furmed into light boards with puas of the bark itself, and are the fomatation of the leafconered boxes of Goran. All the insect-boxes I nsed in the Muluceas were thus nade at Amboyna, and when covered with stout paper inside and out, are strons light, and secure the insect-pins remarkably well. The leatlets of the sago fokded and time side by side on the smaller midribs fiom the "atip" on thateh in miversal use, while the product of the trank is the staple food of some lnumbed thousurads of net.
saco cluts.
When saso is to be made, a full-grown tree is selected just before it is goiug to flower. It is cut down close to the ground, the leaves and leaf-stalles cleared away, and a lirond strip of the bark taken ofl the upper side of the tamk. This expmses the pithy matter, which is of a rusty colvur now the bottom of the tree, but higher up pure
white, about as had as a dry apple, but with wondy fibres rumning throush it ahout a quarter of an inch apart. This pith is cut or broken down into a coarse powder by means of a tool constracted for the purpose-it club of hand and heaty wook, having a piece of sharp ghatz rock firmly imbeded into its litunt end, and projecting about hadf an inch. liy suceessive blows of this, narrow strips of the pith are cut away, and fall down into the cylinder formed by the hark, Procedding steadily on, the whole trunk is cleared out, laving a skin not move than half an inch in thickness. This material is carried away 'in baskets made of the sheathing hases of the leaves) to the nearest water, where a washing-machine is put up, which is compreed

RAgJ WASALIER
almost entirely of the saro tree itself. The large sheathing hases of the leases form the troughs, and the fibrous cosering from the leaf-stalks of the young cocon-nut the strainer. Water is ponted on the mass of pith, which is kneaded and pressed against the strainer till the starh is all dissolved and has passed through, when the fibrous refuse is thrown away, and a fresh basketful phat in its phace. The water
charged with sago starch passes on to a trough, with a depression in the centre, where the sediment is deposited, the surplus water trickling off by a shallow outlet. When the trough is nearly full, the mass of starch, which has a slight reddish tinge, is made into cylinders of about thirty pounds' weight, and neatly coverel with sago leaves, and in this state is sold as raw sago.

Boiled with water this forms a thick glutinous mass, with a rather astringent taste, and is eaten with salt, limes, and chilies. Sago-bread is made in large quantities, by baking it into cakes in a small clay oven containing six or eight slits side by side, each aloont three-quarters of an inch wide, and six or eight inches square. The raw sago is broken up, dried in the sun, powlered, and fincly sifted. The oven is heated over a clear fire of emhers, and is lightly filled with the sagopowder. The openings are then covered with a flat piece of sago bark, and in about

BAgO ATFX, five minutes the enkes are turned out sufficiently baked. The hot cakes are very nice with butter, and when made with the addition of a little sugar and grated cocoa-nut are quite a delicacy. They are soft, and something like corn-flour cakes, but have a slight characteristic flavour which is lost in the refined sago we use in this country. When not wanted for immediate use, they are dried for several days in the sun, and tied up in bundles of twenty. They will then keep for years; they are very hard, and very rough and dry, hut the people are used to theru from infancy, and little chihren may be seen grawing at them as contentedly as ours with their lread-aul-butter. If dipped in water and then toasted, they lwome almost as grood as when fresh baked; and thus treated they were my daily substitute for bread with my coffee. Soaked and boiled they make a very good pudding or vegetable, anl served well to economize our rice, which is sometimes difficult to get so far east.

It is truly an extraordinary sight to witness a whole
tree-trank, perhaps twenty feet long and four or tive in erreumference, converted into food with so little hibour and preparation. A good-sized tree will produce thirty tomans or bundles of thirty poumds each, and each toman will make sixty cakes of three to the pound. Two of these cakes are as much as a man can eat at one meal, and five are considered a full day's allowance; so that, reckoning a tree to produce 1,800 eakes, weighing 600 pounds, it will supply a man with food for a whole year. The labour to produce this is very moderate. Two men will finish a tree in five days, and two women will bake the whole into cakes in five days more; but the raw sago will keep very well, and can be baked as wanted, so that we may estimate that in ten days a man may produce food for the whole year. This is on the supposition that he possesses sago trees of his own, for they are now all private property. If he does not, he has to pay about seven and sixpence for me; and as labour here is five pence a day, the total cost of a year's food for one man is about twelve shillings. The effect of this cheapness of food is decidedly prejudieial, for the inhbibitants of the sago countries are never so well off as those where rice is cultivated. Many of the people here have neither vegetables nor fruit, but live almost entirely on sago and a little fish. Having few occupations at home, they wander about on petty trading or tishing expeditions to the neighbouring islands; and as far as the conforts of life are concerned, are much inferion to the wild hill-Dyaks of Borneo, or to many of the more barbarous tribes of the Archipelago.

The country round Warts-warus is low and swampy, and owing to the alsence of cultivation there were scarcely any paths leading into the forest. I was therefore unable to collect much during my enforced stay, and found no rate birds or insects to improve my opinion of Ceram as a collecting ground. Finding it quite impossible to get men here to accompany me on the whole voyare, I was ohliged to he content with a erew to take me as far as Wahai, on the middle of the nurth coast of Ceran, and the chief Huteh station in the island. The joumey took us five days, owing to calms and linht winds, and no incident of any interest ocemred on it, nor did I obtain at our
stopping places a single addition to my collections worth naming. At Wahai, which I reached on the 15th of June, I was hospitably received by the Commandant and my old friend Herr Rosenberg, who was now on au official visit here. He lent me some money to pay my men, and I was lucky enough to obtain three others willing to make the voyage with me to Temate, and one more who was to return from Mysol. One of my Amboyna lads, however, left me, so that I was still rather short of hands.

I found here a letter from Charles Allen, who was at Silinta in Mysol, anxionsly expecting me, as he was out of rice and other necessaries, and was short of insect-pins. He was also ill, and it I did not soon come would return to Wahai.

As my voyage from this place to Waigion was among islands inhabited by the I'aphan race, and was an eventful and disastrous one, I will narrate its chief incidents in a separate chapter in that division of my work devoted to the Papuan Islands. I now have to pass over a year spent in Waigion and Timer, in order to describe my visit to the island of Pourn, which concluded my explorations of the Moluceas.

## CHAPTER XXVF.

BoURU.
(May and Juse 1861. Mop, p. 2pg.)

IHAD long wished to visit the large island of Bourn, which lies due west of Ceram, and of which scarcely anything appeared to he known to naturalists, except that it contained a babirusa very like that of Celebes. I therefore made arraugements for staying there two months after leaving Timor Delli in 1861. This I could conveniently do by means of the Dutch mail-steamers, which make a monthly round of the Moluccas.

We arrived at the harbour of Cajeli on the 4 th of May;
a gun was fired, the Commandant of the fort cane alougside in a native byat to receive the post-packet, and took me and my baggage on shore, the steamer going oll again without coming to an anchor. We went to the house of the Opzeiner, or overseer, a native of Amboyna-Bonru being two poor a place to deserve even an Assistant Resident; yet the appearance of the village was very far superior to that of Delli, which possesses "His Excellency the Governor," and the little fort, in perfect order, surrounded by neat grass-plots and straight walks, althongh manned by only a dozen Javanese soldiers with an Adjutant for commander, was a very Scbastopol in comparison with the miserable mod enclosure at Delli, with its numerous staff of Lieutenants, Captain, and Major, Yet this, as well as most of the forts in the Moluccas, was originally built by the Portuguese themselves. Oh! Lusitania, how art thou fallen!

While the Opzeiner was reading his letters, I took a walk round the village with a guide in search of a house. The whole place was dreadfurly damp and muddy, being built in a swamp with not a spot of ground raised a foot above it, and surrounded by swamps on every side. The houses were mostly well built, of wooden framework filled in with gaba-gaba (leaf-stems of the sago-palm), but as they had no whitewash, and the floors were of bare black earth like the roads, and generally on the same level, they were extremely damp and gloomy. At leugth I found one with the floor raised about a foot, and succeeded in making a hargain with the owner to turn out immediately, so that by uight I had installed myself comfortably. The chairs and tables were left for me; and as the whole of the remaining furniture in the house consisted of a little crockery and a few clothes-boxes, it was not much trouble for the owners to move into the house of some relatives, and thus obtain a few silver rupees very easily. Every foot of ground between the houses throughout the village is crammed with fruit trees, so that the sun and air have no chance of penetrating. This most be very cool and pleasant in the dry season, hut makes it damp and unhealthy at other times of the year. Unfortunately I had come two months too soon, for the rains were not yet over,
and mud and water were the prominent fentures of the country.

About a mile behind and to the east of the village the hills commence, but they are very baren, being covered with scanty coarse grass and scattered trees of the Melatenca cajuputi, from the leaves of which the celebrated cajeput oil is made. Such districts are absolutely destitute of interest for the zoologist. A few miles further on rose higher mountains, apparently well covered with forest, but they were entirely uninhabited and trackless, and practically inaccessible to a traveller with limited time and means. It became evident, therefore, that I must leave Cajeli for some better collecting ground, and finding a man who was going a few miles eastward to a village on the coast where he said there were hills and forest, I sent my boy Ali with him to explore and report on the capabilities of the district. At the same time I arranged to go myself on a little excursion up a river which flows into the bay about five miles north of the town, to a village of the Alfuros or indigenes, where I thought I might perhaps find in good collecting ground.

The Rajah of Cajeli, a good-tempered old man, offered to accompany me, as the village was under his government; and we started one morning early, in a long narrow hoat with eight rowers. In about two hours we entered the river, and commenced our inland journey against a very powerful cument. The stream was about a hundred yards wide, and was generally bordered with high grass, and occasionally loushes and palm-trees. The country round was that and more or less swampy, with seattered trees and shrubs. At every bend we crossed the river to avoid the strength of the current, and arrived at our landingplace about four oclock, in a torrent of rain. Here we waited for an hour, crouching under a leaky mat till the Alfuros arrival who had heen sent for from the village to carry my bagrage, when we set off along a path of whose extreme muidiness I had been wanned before starting.

I turned up my trousers as high as possible, graspel a stont stick to prevent awkward falls, and then boldly plunged into the first mud-hole, which was immedistely
succeeded by another and another. The mud or mud and water was knee-deep, with little intervals of firmer ground between, making promression exceedingly difficult. The path was bordered with high rigid grass, growing in dense clumps separated by water, so that nothing was to be gained by leaving the baten track, and we were olliged to go floundering on, never knowing where our feet would rest, as the mud was now a few inches, now two feet, deep, and the bottom very meven, so that the fout slid down to the lowest part, and made it diflicult to keep one's balance. One step would be upon a concealed stick or log, almost dislocating the ankle, while the next would plunge into soft mud above the knee. It rained all the way, and the long grass, six feet high, met over the path; so that we could not see a step of the way alead, and received a double drenching. Belore we got to the village it was dark, and we had to cross over a small hut deep and swollen strean by a narrow log of wood, which was more than a fuot under water. There was a slender shaking stick for a linndrail, and it was nervous work feeling in the dark in the rushing water for a sate place on which to place the advanced foot. After an hour of this most disugreeable and fatiguing walk we reached the village, followed by the men with our guns, ammunition, boxes, and bedding, all more or less soaked. We consoled ourselves with some hot tea and cold fowl, and went carly to bed.

The next morning was clear and fine, and I set out soon after sumrise to explore the neighbourhood. The village had evidently been newly formed, and consisted of a single straight street of very miserable luts totally delicient jn every comfort, and as hare aud cheerless inside as out. It was situated on a little elevated patch of coarse mravelly soil, covered with the usual high rigid grass, which came up close to the backs of the houses. At a short distance in several directions were patches of forest, but all on low and swampy ground. I made one attempt along the only path I could find, but soon came upon a deep mud-hole, and found that I must walk barefoot if at all ; so I returned and deferred further exploration till after breakfast. I then went on into the jungle and found patches of sagopalms and a low forest vegetation, but the paths were every-
where full of mud-holes, and intersected by muddy streams rind traets of swamp, so that walking was not pleaswrable, and too much attention to one's steps was not favourable to insect catching, which requires above everything freedom of motion. Ishot a few birds, and canght a few buttarlies, but all were the same as I had alrendy ohtained about Cajeli.

On my return to the village $I$ was told that the same lind of eromml extembed for many miles in every direction, and $I$ at once decided that Wayapo was not a suitable piace to stay at. The next morning early we waded back again though the mud and long wet mass to our boat, and by mid-day reached Cajeli, where I waited Alis return to decide on my future movements. He came the followinur day, and gave a very bud account of Pelah, where he had been. There was a little bush and trees alons the bench, and hills inland covered with high grass und cajuputi trees-my dread and abhorrence. On inquiring who conld give me trustworthy information, I was referred to the Lieutenant of the Burghers, who had travelled all romed the islaud, and was a very intelligent fellow. I asked him to tell me if he knew of any part of Bouru where there was no "kusu-kusu," as the coarse grass of the country is ealled. He assmed me that a rood deal of the south coast was forest land, while along the north was almost entirely swamp and frassy hills. Alter minute inquiries, I foumb that the forest country commenced at a place called Waypoti, only a few miles beyond Pelan, but that, as the coast beyond that place was exposed to the uast monsoon and dangerous for Iraus, it, was necessary to walk. I inmediately went to the Opzeiner, and he called the Rajah. We had a consultation, and arranged for a boat to take me the next evening but one, to Pelah, whence I was to proceed on foot, the Oranekaya going the day before to call the Alfuros to carry my bagrage.

The journey was made as ammoed, and on May 19th wo arriven at Waypoti, having walked about ten miles along the beach, and throngh stony forest bordering the sen, with necasiomal lunges of a mile or two into the interior. We found no village, bat scatherel houses and plantations, with hilly country proty well covered with torest, and lowking mother promising. A low hat with a
very rotten roof, showing the sky through in several places, was the only one I could obtain. Luckily it did not rain that night, and the next day we pulled down some of the walls to repair the roof, which was of immediate importance, especially over our beds and table.

About half a mile from the lonse was a fine mountain stream, ruming swiftly over a bed of rocks and pebbles, and beyond this was a hill covered with fine forest. By carefully picking my way I could wade across this river without getting much above my knees, although I would sometimes slip off a rock and go into a hole up to my waist, and about twice a week I went across it in order to explore the forest. Uufortunately there were no paths here of any extent, and it did not prove very productive either in insects or birts. To add to my difficulties I had stupidly left my only pair of strong boots on board the steamer, and my others were by this time all dropping to pieces, so that I was obliged to walk about barefooted, and in constant fear of hurting my feet, and causing a wound which might lay me up for weeks, as had happened in Borneo, Aru, and Dorey. Although there were numerons plantations of maize and plantains, there were no new clearings; and as without these it is almost impossible to find many of the best kinds of insects, I determined to make one myself, and with nuch difficulty engaged two men to clear a patch of forest, from which I loped to obtain many fine beetles before I left.

During the whole of my stay, however, insects never became plentiful. My clearing produced me a few fine longicorns and Buprestidx, different from any I had before seen, together with several of the Amboyna species, but by no means so mumerous or so beautiful as I had foumd in that small island. For example, I collected only 214 different kinds of beetles during my two months' stay at Bouru, while in three weeks at Amboyua, in 1857, I found more than 300 species. One of the finest insects found at Bouru was a large Ceramlyx, of a deep shining chestmut coiour, and with very long antenue. It varied greatly in size, the largest specimens being three inches long, while the smallest were only an inch, the antenna varying from one and a ladif to five inches.
c c 2

One day my boy Ali came home with a story of a big snake. He was walking through some high grass, and stepped on something which he took for a small fallen tree, but it felt cold and yielding to his feet, and far to the right and lett there was a waving and rustling of the leerbage. He jumped back in atfright and prepared to shoot, but could not get a good view of the creature, and it passed away, le said, like a tree being dragged along through the grass. As he had several times alrady shot lange snakes, which he declared were all as nothing compared with this, I am inclined to believe it must really have been a monster. Such creatures are rather pleatiful here, for a man living cluse by showed me on his thigh the marks where he had been seized by one close to his house. It was bir enough to take the man's thigh in its mouth, and he would prohably have been killed and devoured by it had not his eries bronght out his neighbours, who destroyed it with their choppers. As far as I could make out it was about iwenty feet long, but $A$ li's was probably much larger.

It sometimes amuses me to observe how, a few days after I lave taken possession of it, a native hut seens quite a comfortable home. My house at Waypoti was a bare shed, with a large bamboo plationn at one side. At one end of this platform, which was elevated about three feet, I fixed up wy mosquito curtain, and partly enclosed it with a large Scotch plaid, making a comfortable little sloeping apartment. I put up a rude table on legs huried in the eathen tloor, and had my connortable matan-chair for a seat. A line across one comer carried my dailywashed cotton clothing, and on a bamboo shelf was arranged my swall stock of crockery and hardware, Boxes were ranged against the thatch walls, and hanging shelves, to preserve my collections from ants while drying, were suspended both without and within the house. On my table lay books, peuknives, scissors, pliers, aud pins, with insect and bird labels, all of which were unsolved mysteries to the native mind.

Most of the people here had never seen a pin, and the better inforned took a pride in teaching their more ignorant companious the peculiarities and uses of that
strange European proluction-a needle with a head, but no eye! Even paper, which we throw away hourly as rubbish, was to them a curiosity; and I often saw them picking up little scraps which had been swept out of the house, and carefully putting them away in their betelpouch. Then when I took my morning coffee and eveniug tea, how many were the strange things displayed to them? Teapot, teacups, teaspoons, were all more or less curions in their eyes; tea, suyar, biscuit, and butter, were articles of human consumption seen by many of them for the first time. One asks if that whitish powder is "gula passir" (sand-sugar), so called to distinguish it from the cuarse lump palm-sugar or molasses of native manufacture ; and the biscuit is considered a sort of European sago-cake, which the inhabitants of those remote regions are obliged to use in the absence of the gemine article. My pursuits were of course utterly beyond their comprelension. They continually asked me what white people did with the birls and insects I took so much care to preserve. If I only kept what was beautiful, they might perhaps comprehend it; but to see ants and dies and small ugly insects put away so carefully was a great puzzle to them, and they were convinced. that there must be sone medical or magical use for them which I kept a profound seceret. These people were in fact as completely unacquainted with civilized life as the Indians of the Looky Mountains, or the savages of Central Africa-yet a steamship, that highest triumph of human ingenuity, with its little floating epitome of European civilization, tonches monthly at Cajeli, twenty miles off; white at Amboyna, only sixty miles distant, a European population and government have been established for more than three hundred years.

Having seen a grood many of the natives of Bouru from different villages, and from distant parts of the island, I feel convinced that they consist of two distinet races muw partially amalgamated. The larger portion are Malays of the Celebes type, often exactly similar to the Tomore preople of East Celebes, whom 1 foumd settled in Batchian; while others altogether resmble the Alfurss of Ceram. The indlux of two races can easily be necmated for. The Sula Islands, which are closely connected with Last

Celebes, approach to within forty miles of the north coast of Bouru, while the island of Manipa offers an easy point of departure for the people of Ceram. I was confirmed in this view by finding that the languares of Bouru possessed distinct resemblances to that of Sula, as well as to those of Ceram.

Soon after we had arrived at Waypoti, Ali had seen a beautiful little bird of the genus Pitta, which I was very anxious to obtain, as in almost every island the species are different, and noue were yet known from Bouru. He and my other hunter continued to see it two or three times a week, and to hear its peculiar note much oftener, but could never get a specimen, owing to its always frequenting the most dense thorny thickets, where only hasty glimpses of it could be obtained, and at so short a distance that it would be difficult to avoid blowing the bind to pieces. Ali was very much annoyed that he could not get a specimen of this bird, in going after which he had alrealy severely wounded his feet with thorns; anl when we hat only two days more to stay, he went of his own accom one exemims to sleep at a little hut in the forest some miles ofil, in order to have a last try for it at daybreak, when many birds come out to feed, and are very intent on their moruing weal. The next evening he brought me home two specimens, one with the head blown completely off, and otherwise too much injured to preserve, the other in very good order, and which I at once saw to be a new species, very like the Pitta celebensis, but ornamented with a square patch of bright red on the nape of the neck.

The next lay after securing this prize we returned to Cajeli, and packing up my collections left Bouru by the steamer. During our two days' stay at Teruate, I took on board what baggage I had left there, and bade adieu to all my friends. We then crossed over to Menado, on our way to Macassur and Javn, and I finally quitted the Molnceas, among whose luxuriant and heautiful islands 1 had wandered for more than three years.

My collectious in Bouru, though not extensive, were of considerable interest; for out of sixty-six species of birds which I collected there, no less than seventeen were new, or had not been previously found in any island of the

Moluccas. Among these were two kingfishers, Tanysiptera acis and Ceyx Cajeli; n beautiful sumbird, Nectarinea proserpina; a landsome little black and white dycatcher, Monarcha loricata, whose swelling throat was beautifully scaled with metallic blue; and several of less interest. I also obtained a skull of the babirusa, one specimen of which was lilled by native hunters during my residence at Cajeli.

## CHAPTER XXVII.

## the natelal history of the moluceas.

TITE Moluceas consist of three large islands, Gilolo, Ceran, and Boturn, the two former being each about two hundred miles long; and a great jumber of smaller isles and islets, the most important of which are latchian. Morty, Obi, Ké, Timor-laut, and Amboyna; and amoner the smaller ones, Ternate, Tidore, Kaion, and Banda. These occupy a space of ten degrees of latitude by eight of longitude, and they are connected by croups of small islets to New Guinea on the east, the Philippines on the north, Celebes on the west, and Timor on the south. It will be as well to bear in mind these main features of extent and geographical position, while we survey their animal productions and diseuss their relations to the countries which surround them on every side in almost equal proximity.

We will first consider the Mammalia, or wartn-blooded quadrupeds, which present us with some singular anomalies. The land mammals are exceedingly few in number, ouly ten being yet known from the entire group. The bats or airial manmals, on the other hand, are numerous-not less than twenty-five species being already known. But even this exceeding poverty of terrestrial mammals does not at nll represent the real poverty of the Moluceas in this olass of animals; for, as we shall soon see, there is good reason to believe that several of the species have been introduced by man, either purposely or by accident.

The only quadrmmanous aumal in the group is the
curious baboon-monkey, Cynopithecus nigrescens, already described as being one of the characteristic animals of Celebes. This is fomul only in the islaud of Batchian; and it seems so much out of place there-as it is difticult to imagine how it could have reached the island by any natural means of dispersal, and yet not have passed by the same means over the narrow strait to Gilolo-that it seems more likely to have originated from some iudividuals which had escaped from confinement, these and similar animals being often kopt as pets by the Malays, and carried about in their praus.

Of all the carnivorous animals of the Archipelago the only one found in the Moluceas is the Viverm tangalunga, which inhabits both Batchian and Bouru, and probably some of the other islands. I am inclined to think that this also may have been introduced accidentally, for it is often made captive by the Malays, who procure civet from it, and it is an animal very restless and untameable, and therefore likely to escape. This view is rendered still more probable by what Antonio de Morga tells us was the custom in the Philippines in 1002. He says that "the aatives of Mindanoo carry about civet.cats in cages, and sell them in the islands; and they take the civet from them, and let them go agam." The same species is common in the Philippines and in all the large islands of the Indo-Malay region.

The only Molucean ruminant is a deer, which was once supposed to be a distinct species, but is now generally considered to be a slight variety of the Rusa hippelaphns of Java. Deer are often tnmed and petted, and their flesls is so much estecued by all Malays, that it is very matural they shond endeavour to introlnce them into the remote islands in which they settled, and whose luxuriant forests scem so well alapted for their subsistence.

The strange brbirusa of Celebes is also found in Bouru, but in no other Moluccan island, and it is somewhat difficult to imagine how it get there. It is true that there is some approximation between the birds of the Sula Islands (where the babirusa is also found) and those of Bouru, which seems to indicate that these islands have recently been closer together, or that some intervening land has
disappeared. At this time the babirusa may have entered Bourn, since it probably swims as well as its allies the rigs. These are spread all over the Archipelago, even to several of the smaller islands, and in many eases the species are peculiar. It is evident, therefore, that they have some uatural means of dispersal. There is a popular idea that pigs cannot swim, but Sir Charles Lyell has shown that this is a mistake. In his "Principles of Geology" (101h Edit. vol, ii. p. 855) he adduces evidence to show that piss bave swum many miles at sea, and are able to swim with great ease and swiftness. I have myself seen a wild pig swimning across the arm of the sea that separates Singapore from the Peninsula of Malacca, and we thus have explained the curious fact, that of all the large mammals of the Indian region, pigs alone extend beyond the Moluceas and as far as New Guinea, although it is somewhat curious that they have not found their way to Australia.

The little shrew, Sorex myosurus, which is common in Sumatra, Borneo, and Java, is also found in the larger islands of the Moluccas, to which it naly have been accilentally conveyed in native praus.

This completes the list of the placental mammals which are so characteristic of the Indian region; and we see that, with the single exception of the pig, all may very probably have been introduced by man, since all except the pig are of species identieal with those now abounding in the great Malay islands, or in Celebes.

The four remaining mammals are Marsupials, an order of the class Mammalia, which is very characteristic of tho Australian fauna; and these are probably true natives of the Moluceas, since they are either of peculiar species, or if found elsewhere are natives only of New Guinca of North Australia. The first is the suall tying opossum, Belidens ariel, a heautiful little animal, exaetly like a small dying squirel in appearance, but lelonging to the marsupial order. The ether three are species of the curious genus Cuscus, which is $l^{\text {reculiar to the Austro- }}$ Malayan regin. These are onssum-like animals, with a Leng lrehensile tail, of which the terminal half is gemerally bare. They have small heads, large eyes, and a dense
rowing of womlly fur, which is nfen pure white with immatar hark spits of boteles, or sumetimes ashy lown with or wilhout white spots. Thuy liwe in trees, feeding unon the leaves of which they devour lamge quantities. They move abont show ty, ant are tithent to kill, owing to the thickness of their fur, and their tenacity of life. A leavy Tharg of shot will often lodge in the skin and to theen an

CUSEUA 4HESATEIB
Jutm, and eron breaking the spiun on pioweng the batu will not kill them fos some homs. Thu matives werywhere eat their hesh, ami as then motions are so show, casily catch then lyy elimhing ; so that it is womorful they have not been exterminated. It may he, lanever, that their dense woolly fur protects them liom birds of prey, and the ishands they lise in are too thimg inhalitend bor man to lee
able to exterminate them. The figure represents Cusens ornatus, a new species discovered by me in Batchian, aud which also inhabits Ternate. It is peculiar to the Moluceas, while the two other species which inhabit Ceram are found also in New Guinea and Waigiou.

In place of the excessive poverty of manamals which characterises the Moluceas, we have a very rich display of the feathered tribes. The number of species of binds at present known from the various islands of the Molucean group is 265 , but of these only 70 belong to the usually abundant tribes of the waders and swinthers, indicating that these are very imperfectly known. As they are also pre-eminently wanderers, and are thus little fitted for illustrating the geographical distribution of life in a limited area, we will here leave them out of consideration and confine our attention only to the 195 land lirds.

When we consider that all Europe, with its varied climate and vegetation, with every mile of its surface explored, and with the immense extent of temprate Asia and Alrica, which serve as storehouses, from which it is continually recruited, only supports 257 species of land birds as residents or regular inmigrats, we must look upon the numbers already procured in the small and comparatively unknown islands of the Moluceas as indicating a fana of fully average richness in this department. But when we come to examine the family grouss which go to make up this number, we find the most curions deticiencies in some, balanced by equally striking redundeney in others. Thus if we compare the birds of the Moluceas with those of India, as given in Mr. Jerdon's work, we find that the three groups of the parrots, kinglishurs, and pigeons, form nearly ouc-third of the whole land-birts in the former, while they amount to only one-tucntich in the latter country. On the other homd, such wide-spread groups as the thrushes, wablers, and finches, which in India form nearly one-thind of all the land-birds, lwindle down in the Moluccas to one-fouteonth.

The reason of these peculiarities appears to be, that the Molnccan fana has been almost entirely derived from that of New Guinea, in which country the same deticiency and the same luxuriance is to be observed. Out of the
seventy-eight genera in which the Moluccan land-birds may be classed, no less than seventy are characteristic of New Guinea, while only six belong specially to the IndoMalay islands. But this close resemblance to New Guinea genera does not extend to the species, for no less than 140 out of the 195 land-birds are peculiar to the Molucean islands, while 32 are found also in New Guinea, and 15 in the Indo-Malay islands. These facts teach us, that though the birds of this group have evidently been derived mainly from New Guinea, yet the immigration has not been a recent one, since there has been time for the greater portion of the species to have become changed. We find, also, that many very characteristic New Guinea forms have not entered the Moluccas at all, while others found in Ceram and Gilolo do not extend so far west as Bouru. Considering, further, the absence of most of the New Guinea mammals from the Moluccas, we are led to the conclusion that these islands are not fragments which have been separated from New Guinea, but form a distinet insular region, which has been pheaved independently at a rather remote epoch, and during all the mutations it has undergone has been constantly receiving immigrants from that great and proluctive island. The cousiderable length of time the Moluceas lave remained isolated is further indicated by the occurrence of two peculiar genera of hirds, semioptera and Lycocorax, which are found nowhere else.

We are able to clivide this small archipelago into two well-marked group-that of Ceram, including also Bourn, Amboyna, landa, and Ke; and that of Gilolo, inchuling Morty, Batchian, Oli, Ternate, and other small islands. These divisions have each a considerable number of peenliar species, no less than fifty-five being found in the Ceran gronp only; and besides this, most of the separate islands have sonue species peenliar to themselves. Thms Norty island has a peculiar kingfisher, honeysucker, and starling; Ternate has a ground-thrush (litta) and a ttrcatcher; Panda has a Ingeon, a shrike, and a l'itta; Ké has two flycatchers, a Zosterops, a slrike, a king-crow, and a cuckoo; and the remote 'Jmor-lant, which should probably come into the Moluccan group, has a cockatoo
and lory as its only known birds, and both are of peculiar species.

The Moluccas are especinlly rich in the parrot tribe, nc less than twenty-two species, belonging to ten genera, inhabiting them. Among these is the large red-crested cockatoo, so commonly seen alive in Europe, two handsome red parrots of the genus Eclectus, and five of the beautiful crimson lories, which are almost exclusively confined to these islands and the New Guinea group. The pigeons are hardly less abundant or beautiful, twenty-one species being known, including twelve of the beautiful green fruit pigeons, the sualler linds of which are omamented with the most brilliant patches of colour on the head and the under-surface. Next to these come the kingishers, including sixteen species, almost all of which are beautiful, and many are among the most brilliautly-coloured birds that exist.

One of the most curions groups of birds, the Megapodii, or mound-makers, is very abmidant in the Moluccas. They are gallinaceous birds, about the size of a small fowl, and generally of a dark ashy or sooty colour, and they have remarkably large and strong feet and long claws. They are allied to the "Malco" of Celebes, of which an account has already been given, but they differ in habits, most of these birds frefuenting the scrubby jungles along the sea-shore, where the soil is sandy, and there is a considerable quantity of débris, consisting of sticks, shells, seaweed, leaves, \&c. Of this rubbish the Megapodius forms immense mounds, often six or eight feet bigh and twenty or thirty feet in climeter, whici they are enabled to do with comparative ease by means of their large feet, with which they ean grasp and throw backwards a quantity of material. In the centre of this mound, at a depth of two or three feet, the eggs are deposited, and are lutehed by the gentle heat produced by the fermentation of the vegetable matter of the mound. When I first saw these mounds in the island of Lombock, I could hardly believe that they were made by such small birds, but I afterwards met with them frequently, and have once or twice come upon the birds engaged in making them. They run a few steps backwarls, grasping a quautity of loose material
in one foot, and throw it a long way behind them. When once properly buried the aggs seem to be no more cared for, the young birds working their way up through the leap of rubbish, and running of at once into the forest. They come out of the egr covered with thick downy featirers, and have no tail, although the wings are fully developed.

I was so fortunate as to discover a new species (Megapodius wallacei), which inhabits Gilolo, Temate, and Bouru. It is the handsomest bird of the genus, being richly banded with reddish brown on the back and wings; and it differs from the other species in its habits. It frequents the forests of the inturior, and comes down to the ser-beach to deposit its egegs, but insteal of making a mound, or scratching a hole to receive them, it burrows into the sand to the depth of about three feet obliquely downwards, and deposits its egres at the lotton. It then loosely: covers up the mouth of the hole, and is said by the matives to obliterate and disguise its own footmarks lending to and from the hole, by making many other traeks and scratches in the neighbourhood. It lays its eggs only at night, and at bourn a bird was caught early one moming as it was coming out of its hole, in which several eggs were found. All these birds seem to be semi-noctmona, for their loud wailing eries may be constantly heard late into the nitht and long before daybreak in the morning. The cogs are all of a rusty red colour, and very large for the size of the bird, being generally three or three and a q parter iuches long, by two or two and a quarter wide. They are very good eating, and are much sought after by the natives.

Another large and extroordinary lind is the Cassowary, which inhalits the island of Ceram only. It is a stout and strong lind, standing five or six feet ligh, and covered with long comse black hair-like feathers. The head is ormamented with a large horny casque or helmet, and the bare skin of the neck is conspicuous with bright blue and red colonts. The wings are quite absent, and are rephacel by a group of homy black spines like blunt poreupine quills. These binds wander anont the wast monatainous forests that cover the island wi Cown, Feding chictly on fallen fruits,
and on insects or crustacea. The female lays from three to five large and beautifully shagreened green eggs upon a bed of leaves, the male and female sitting upou them alternately for about a month This bird is the helmeted cassowary (Casuarins galeatus) of naturalists, and was for a long time the only species linown. Others have since been discovered in New Guinea, New Britain, and North Australia.
It was in the Moluccas that I first discovered unduubted cases of " mituicry" among birds, and these are so curious that I must briefly describe them. It will be as well, however, first to explain what is meant by mimicry in natural history. At parge 131, I have described a butterily which, when at rest, so closely resembles a dead leaf, that it thereby escapes the attacks of its enemies. This is termed a "protective resemblance," If however the butterlly, being itself a savoury morsel to birds, had closely resembled another buttertly which was disagreeable to birds, and therefore never eaten by them, it would be as well protected as if it resembled a leaf; and this is what has been happily termed "mimicry" by Mr. Bates, who first discovered the object of these curious external imitations of one insect by another belonging to a distiact genus or family, and sometimes even to a distinct order. The clear-winged moths which resemble wasps and lornets are the best examples of "mimicry" in our own country.

For a long time all the known cases of exact resemblance of one creature to quite a different one were confined to insects, and it was therefore with great pleasure that I discovered in the island of Bouru two birds which I constantly mistook for each other, and which yet belonged to two distinct and somewhat distant families. One of these is a honeysucker named Tropidorlynchus bournensis, and the other a kind of oriole, which has been called Mimeta bouruensis. The oriole resembles the honeysucker in the following particulars: the upper and under surfaces of the two birds are exactly of the same tints of dark and light brown ; the Tropidorhynclus has a large bare black patch rond the eyes; this is copied in the Mimeta by a patch of black feathers. The top of the head of the Tropidorlyy-
chus has a scaly appearance from the narrow scale-formed feathers, which are imitated by the broader feathers of the Mimeta having a dusky liue down each. The Tropidorhynchus has a pale ruff formed of curious recurved feathers on the nape (which lats given the whole gents the name of Friar birds) ; this is represented in the Mimeta by a pale band in the same position. Lastly, the bill of the Tropidorhynchus is raised into a protuberant keel at the base, and the Mimeta has the same character, although it is not a common one in the genus. The result is, that on a superficial examination the birds are identical, although they have important structural differences, and cannot be placed near each other in any natural arrangement.

In the adjacent island of Ceram we find very distinct species of both these generi, and, strange to say, these resemble each other quite as closely as do those of Boutu. The Tropidorhynchus subcomutus is of an earthy brown colour, washed with ochreish yellow, with hare orbits, dusky cheeks, and the usual recurved nape-ruft. The Mimeta forsteni which accompanies it, is absolutely identical in the tints of every part of the body, and the details are copied just as minutely as in the former species.

We have two kinds of evidence to tell us which bird in this case is the motel, and which the copy. The honeyswekers are coloured in a manner which is very general in the whole family to which they belong, while the orioles seem to have departed from the gay yellow tints so common among their allies. We should therefore conclude that it is the latter who minic the former. If so, however, they must derive some advantage from the imitation, and as they are certainly weak birds, with small feet and claws, they may require it. Now the Tropidorhynchi are very strong and active birds, having powerful grasping claws, and long, curved, sharp beaks. They assemble together in groups and small flocks, and they have a very loud bawling note which can be heard at a great distance, and serves to collect a number together in time of danger. They are very plentiful and very pugnacious, frequently driving away crows and even hawks, which perch on a tree where a few of them are assembled. It is very probable, therefore, that the smaller birds of prey have

8

leant to respect these birds and leave them alone, and it may thus be a great advantage for the weaker aud less courageous Minetas to be mistaken for them. This being the case, the laws of Variation and Survival of the Fittest, will suffice to explain how the resemblance has heen brought about, without supposing any voluntary action on the part of the birds themselves; and those who have read Mr. Darwin's "Origin of Species" will have no difficulty in comprekending the whole process.

The insects of the Moluceas are pre-eminently beautiful, cven when compared with the varied and beantiful productions of other parts of the Archipelago. The grand bird-winged butterflies (Ornithoptera) here reach their maximum of size and beaty, and many of the Papilios, Picride, Danaide, and Nymphatide are equally preeminent. There is, perlaps, no island in the world so small as Anboyna where so many grand insects are to be found. Here are three of the very finest Ornithopterepriamus, helema, and remus; three of the handsomest and largest Papilios-ulysses, deiphobus, and gambrisius; one of the handsomest licringe, lphias leucippe; the largest of the Danaida, Hestia idea; and two musually large and hatudsome Nymphalide-Diatema pandarus, and Charaxes euryalus. Among its beetles are the extratordinary Euchirus longimanus, whose enormous legs spread over a space of eight inches, and an unusual number of large and haudsome Longicorns, Anthribide, and Buprestide.

The beetles figured on the plate as characteristic of the Moluceas are: 1. A small specimen of the Euchirus longimanus, or Long-amed Chafer, which has been already mentioned in the account of my resideuce at Amboyna (Chapter XX.). The female has the fore legs of moderate lingth. 2. A fime weevil, (an undescribed species of Eupholus,) of rich blue and emerald green colours, banded with black. It is a mative of Ceram and Goram, and is found on foliage. 3. A female of Xenocerus semilucluosus, one of the Authribite of delicate silky white and black colours. It is abundant on fallen trunks and stumps in Ceram and Amboymn 4. An undescribed species of Xenocerus : a mate, with very long and curions antemma, and elegant black and white markings.

It is furud on fallen truks in Batchian. 5. An undescribed species of Arathnobas, a curious genus of weevils peculiar to the Moluccas and New Guinea, and remarkable for their long legs, and their habit of often sitting on leaves, and turning rapidly round the edge to the under-surface when disturbed. It was found in Gilolo. All these insect:: are represented of the natural size.

Like the birds, the insects of the Moluccas show a decided aflinity with those of New Guinea rather than with the productions of the great western islands of the Archipelago, but the difference in form and structure between the productions of the east and west is not nearly so marked here as in birds. This is probably due to the more inmediate dependence of insects on climate and vegetation, and the greater facilities for their distribution in the varied stages of egg, pupa, and perfect insect. This las led to a general uniformity in the inseet-life of the whole Archipelago, in accordance with the general uniformity of its climate and vegetation; while on the other hand the great susceptibility of the insect organization to the action of external conditions has led to infinite detailed modifications of form and colour, which have in many cases given a considerable diversity to the productions of adjacent islands.

Uwing to the great preponderance among the birds, of parrots, pigeons, kingfishers, and sunbirds, almost all of gay or delicate colours, and many adomed with the most gorgeous plumage, and to the numbers of very large and showy butterfies which are almost everywhere to be met with, the forests of the Moluccas ofler to the naturalist a very striking example of the luxuriance and beauty of animal life in the tropics. Yet the almost entire alsence of Mammalia, and of such wide-spread groups of birds as woodpeckers, thrushes, jays, tits, and pheasants, must convince him that he is in a part of the worle which has in reality but little in common with the great Asiatic continent, although an unbroken chain of islands seems to link them to it.

## CHAPTER XXVIII.

## MdCASSAR TO THE ARU ISLANDS IN A NATIVE PRAU,

(DRCEMBER, 1856.)

$\mathrm{I}^{\mathrm{T}}$T was the heginning of December, and the rainy season at Macassar had just set in. For nearly three months I had beheld the sun rise daily above the palm-groves, mount to the zenitl, and descend like a globe of fire into the ocean, unobscured for a single moment of his course: now dark leaden clouds lad gathered over the whole heavens, and secmed to have rendered him permanently invisible. The strong east winds, warm and dry and dustladen, which had hitherto blown as certainly as the sun had risen, were now replaced by variahle gusty breezes and heavy rains, often continuous for three days and nights together; and the parelved and fissured rice stubbles which during the dry weather had extended in every direction for miles around the town, were already so flooded as to he only passable by boats, or by means of a labyrinth of paths on the top of the narrow banks which divided the separate properties.

Five months of this kind of weather might be expected in Southem Celebes, and I therefore determined to seek some more favourable climate for collecting in during that period, and to return in the next dry season to complete my exploration of the distriet. Fortunately for me I was in one of the great emporiums of the native trade of the Archipelago. Rattans from Borneo, sandal-wood and hees'wax from Flores and Timor, tripang from the Gulf of Carpentaria, cajuputi-oil from Bouru, wild mutmegs and mussoi-bark from New Guinea, are all to be found in the stores of the Chinese and Bugis merehants of Macassar, along with the rice and coffee which are the chief products of the surrounding country. More important than all these however is the trade to Aru, a group of islands situated on the south-west coast of New Gninea, and of which almost the whole produce comes to Macasar in mative vessels.

$$
1 \mathrm{~L} 2
$$

These islands are quite out of the track of all European trade, and are inhabited only by bhack mop-headed savages, who yet contribute to the luxurious tastes of the most civilized races. P'earls, nother-of-pearl, and tortwiseshell, find their way to Europe, while edible birds' nests and "tripang" or sea-slug are obtained by shiploads for the gastronomic enjoyment of the Chinese.

The trade to these islands has existed from very early times, and it is from them that Birds of Pamadise, of the two kinds known to Linneus, were first brought. The mative vessels can only make the voyage once a year, owing to the monsoons. They leave Macassar in Deeember or January at the beginning of the west monsoon, and return in July or August with the full strength of the east monsoon. Even by the Macassar people themselves, the voyage to the Aru Islands is looked upon as a rather wild and romantic expedition, full of novel sights and strange adventures. He who has made it is looked up to as an authority, and it remains with many the unachieved atmbition of their lives. 1 myself had hoped mather than expected ever to reach this "Ultima Thule" of the Last and when I foum that I really could do so now, had I but courage to trust myself for a thousand miles' voyage in a bugis prau, and for six or seven months among lawless traders and feroeions savages,-I felt somewhat as I did when, a sehoolhoy, I was for the first time allowed to travel outside the stage-coach, to visit that scene of all that is strange and new and wonderful to young imaginations -london :

By the help of some kind friends I was introduced to the owner of one of the large prans which was to sail in a few days. He was a Javanese Lalf-caste, intelligent, mild, and gentlomanly in his manners, and had a young and prethy Duteh wife, whom he was going to leave behind during lis absence. When we talked about passage money he would fix no sum, but insisted ou leaving it entirely to me to pay on uy return exactly what I liked. "Aud then," said he, " whether you give me one dollar or a hundred, I shall be satistied, and shall ask no more."

The remainder of my stay was fully oceupied in laying in stores, engaging servauts, and making every other pre-
paration for an absence of seven munths from even the outskirts of civilization. On the morning of Deember 13h, when we went on board at daybreak, it was raining hard. We set sail ant it came on to blow. Otar boat was lost astern, our sails dimated, and the evening found us back again in Macassar harbour. We remained there four days longer, owing to its raning all the time, thas rendering it impossible to dry and repair the lruge mat sails. All these dreary days 1 remained on hoard, and during the rave intervals when it didu't rain, made nyself aequaimed with our ontandish craft, sone of the peenharities of which I will now endeavour to describe.

It was a vessel of about seventy tons burthen, and shaped something like a Chineso junk, The teck sloped considerally downward to the bows, which are thas the lowest part of the ship. There were two latre rulders, but instead of heing placed astorn they were homg on the quarters lrom strong cross heams, which projected out two or three foet on each side, and to which extent the deck overhnag the sides of the vessel anidships. The rudders Were not hinged lut lung with slings of rattan, the friction of which keeps them in any position in which they are placed, and thus perhaps facilitates steering. 'Thse tillers were not on deek, but entered the vessel through two square openings into a lower or hall' deck about three feet high, in which sit the two steersmen. In the after part of the vessel was a low poop, about three and a laild feet high, which forms the captain's cabire, its furniture consistiug of boxes, mats, and pillows. In front of the perg and matrmast was a little thatched house on deek, athont bour feet figh to the ridge ; and one compartment of this, forming a cabin six and a half feet long by five and a halt wite, I had all to myself, and it was the smuggest and most comfortable little pace 1 ever enjoyed at sat. It was entered by a low sliding door of thatch on one site, and hat a very sinall window on the other. The floor was of split hamboo, pleasantly clastic, rased six inches above the deck, so as to le quite dry. It was covered with fine cane mats, for the monnfacture of which Hacassar is celebrated; against the further wall were arrmged my gun-case, insect-boxes, clothes, and books; my mattress occupied the midde, and
next the door were my canteen, lamp, and little store of luxuries for the voyage; while guns, revolver, and humting knife hung eonveniently from the roof. During these four miserable days I was quite jolly in this little sunggerymore so than I should have been if contined the same time to the gilded and uneomfortable saloon of a first-class steamer. Then, how eomparatively sweet was everything on board-no paint, no tar, no new rope, (vilest of smells to the qualmish:) no grease, or oil, or varnish; but instead of these, bamboo and rattan, and coir rope and palm thatch; pure veretable fibres, which suell pleasantly if they sumdl at all, and recall quiet seenes in the green and shady forest.

Our ship hat two masts, if masts they can be called, whiel were great moveable triangles. If in an ordinary ship you replace the shrouds and backstay by strong timbers, and take away the mast altogether, you have the arangement adepted on board a pratu. Above my cabin, and resting on cross-beams attached to the masts, was a widerness of yards and spars, mostly formed of bamboo. The mainyard, an immense affinir nearly a hundred leet long, was formed of many pieces of wood and bamboo bound together with rattans in an ingenious manner. The sail carried by this was of an oblong shape, and was hung out of the centre, so that when the short end was hauled down on deek the long end mounted high in the air, making up for the lowness of the mast itself. The foresail was of the same shape, but smaller. Luth these were of matting, and, with two jibs and a fore and aft sail astem of cotton canvas, completed our riy.

The crew consisted of about thirty men, natives of Macassar and the adjacent coasts and jislands. They were mostly young, and were short, broad-faced, good-humoured looking fellows. Their dress consisted geucrally of a pair of trousers only, wheu at work, and a handkerchicf twisted round the head, to which in the evening they would add a thin cotton jacket. Four of the elder men were "jurumudis," or steersmen, who had to squat (two at a time) in the little steerage before described, changing every six hours. Then there was an old man, the "juragan," or captain, but who was really what we should call the tirst mate; he oceupied
the other half of the little house on deek. There wem about ten respectable men, Chinese or Bugis, whom out owner used to call "his own people." He treated them very well, shared his meals with them, and spoke to them always with perfect politeness; yet they were most of then a kind of slave debtors, bound over by the police magistrate to work for him at mere nominal wages for a term of years till their debts were liquidated. This is a Dutch institution in this part of the word, and seems to work well. It is a great boon to traders, who can do nothing in these thinly-populated regions without trusting goods to agents and petty dealers, who frequently squander them away in gambling and debauchery. The lower classes are almost all in a chronic state of debt. The merchant trusts them again and again, till the amount is something serions, when he brings them to court and has their services allotled to him for its liquidation. The deutors seem to think this no disgrace, but rather enjoy their freedom from responsibility, and the dignity of their prosition under at wealthy and well-known merchant. They trade a little on their own account, and both parties seem to get on very well together. The plan scems a more sensible one than that which we adopt, of effectually preventine a man from earning anything towards paying his debts by shutting him up in a jail.

My own servants were three in number. Ali, the Malay loy whom I had picked up in Borneo, was my head man. He had already been with me a yoar, could turu his hand to anything, and was quite attentive and trustworthy. Ite was a good shot, and fond of shooting, and I had tanght him to skim bitds very well. The second, named Baderoon, was a Macassar lad, also a pretty good hoy, but a lesperate gambler. Under pretence of buying a house for his mother, and clothes for himself, he had received four months' wages about a week before we sailed, and in a day or two gumbled away every dullar of it. He had come on baral with no clothes, no betel, or tobacco, or salt fish, all which necessary articles I was obliged to send Ali to buy for him. These two lads were about sixteen, I should suppose; the third was younger, a sharp little rascal named Baso, who had been with me a month or two, and had learnt to
cook tolerably. Me was to hilfil the important ollice of cook and housekeeper, for I cond not get any regrlar servants to go to sucla a terribly remote commery; one might as well ask a chey de cutisime to go to lataronia.

In the fifth day that I had spent on board (Dee. Inth) the rain coasal, and final preparations were nade for sharting. Sails were drided and furlenl, bonts were constantly coming and going, and stores for the voyare, fruit, veretables, fish, and pathen sugar, were taken on board. In the atternoon two women arived with a large party of friends and relations, and at parting there was a general noserubbing (the Malay kiss), and some tears shed. These were pronising syingtoms for our getting off the mext day; zud aceurlingly, it three in the morning, the owner came on board, the anchor was immediately woghed, and by four we set sail. Just as we were fairly ofl and clear of the other pratus, the ohd juraran repeated some prayers, all around respenting with "Allah il dHah," and a few strokes on a gong as an necompaniment, conchoding with all wishing each other "Salamat jalan," a sate and happy journey. We land a light breeze, a calm sea, and a time homing, a prosperous commencement of our voyage of about a thonsand miles to the far-famed Aru Islands.

The wind contmod light and variable all day, with a calm in the evening before the land breeze sprang up. We were then passing the island of "Tanakaki" (foot of the land), at the extreme sonth of this part of Celelies. There are some dangerons rocks here, and as I was standing by the bulwarks, I hapencel to spit over the side; one of the men begred I would not do so just now, but spit on deek, as they were much afraid of this phace. Not quite comprehending, I made him re, eat his request, when, soeing he was in earnost, I sail, "Very well, I sumbose there are "hautus' (spirits) lure." Yes," said he, "and they don't lite anything to be thown overbome; many a pran has been lust by doing it." Lipon which I promised to he very careful. At sunset the good Mahometans on bourd all repeated a few words of prayer with a general chorus, reminding me of the pleasing and impressive "Ave Maria" of Catholic countries.

Dec. 20th.-It sumise we were opposite the Bontyne
mountain, said to be one of the highest in Celebes. In the afternoon we passed the Salayer Straits and had a little squall, which obliged us to lower our huge mast, sails, and heavy yards. The rest of the evening we had a fine west wind, which carried us on at near live knots an hour, as much as our lumbering old tub can possibly go.

Dec. 21 st.- $A$ heavy swell from the south-west rolling us about most meomiontably. A steady wind was blowing, however, and we got on very well.

Dec. ${ }^{2}-d$. - The swell had grone down. We passer Boutong, a large islamd, high, woody, and populous, the native place of some of our crew. A smatl pratu returning From Bali to the island of Goram overtorok us, The nakoda (captain) was known to our owner. They had been two years away, but were full of people, with several hack Papuans on board. At 6 r.m. we passed Wangiwangi, low but not flat, inhabited and subject to Bontong. We had now faily entered the Molucca Sua. After dark it was a batutiful sight to look down on our rudelers, from which rushed eddying streams of phosphorie light remued with whirling sparks of fire. It resembled (wore nearly than anything else to which I can compare it) one of the large irregular nebulous star-clusters seen through a good telescope, with the additional attraction of ever-changing form and dancing motion.

Dec. 23d.-Fine red sumise; the island we left last evening barely visible behind us. The Goram prau about a mile south of us. They have no compass, yet they have kept a very true course during the night. On owner tells the they do it by the swell of the sea, the direction of which they notice at sunset, aud sail by it during the night. In these seas they are never (in fine weather) more than two days whithont seeing land. Of course adverse winds or currents sometimes carry them away, but they som fall in with some island, and there are always some old sailors on board who know it, and thence take a new course. Last night a shark abont five feet long was canght, and this morning it was cut up and cooked. In the afternoon they got another, fund [ had a little fried, and found it tirm and dry, but very palatable. In the evening the sun set in a heary bank of clonds, which, as darkress came on,
assumed a feartully black appearance. According to custon, when streng wind or rain is expected, our large sails were furled, und with thirir yards let down on deck, and a small square foresail alone kept up. The great mat sails are most awkword things to manaye in rough weather. The yards which support them are seventy rect long, and of course very leavy; and the only way to furd them being to pall up the sail on the boom, it is a very dangerous thing to have them standiug when overtaken by a squall. Our crew, thengh numerous enough for a vessel of 700 instead of one of 70 tons, have it very much their own way, and there seems to be seflom mome than a dozen at work at a time. When anything important is to be done, however, all start up willingly enough, but then all think themselves at liberty to give their opinion, and bulf a dozen voices are heard giving orders, and there is such a shrieking and confusion that it seens wonderful anything gets done at all.

Considering we lave fifty men of several tribes and tongues on board, wild, hall-satiage lowking fellows, and few of them feeling any of the restraints of morality or education, we get on woulerfully well. There is no tighting or quarrelling, as there would certainly lee annog the same number of buropeans with as litte restrant uron their actions, and there is scarcoly any of that noise and exeitement which might be expected. In fine weather the greater part of thom are quictly enjoying themselvessome are sleeping umber the shadow of the sails; others, in little groups of three or four, are talking or chewing betel; one is makiug a new handle to his chopping-knife, another is stitching away at a new pair of trousers or a shirt, and all are as quiet and well-conducted as on board the bestordered English merchantnan. Two or three take it by turns to wates in the bows and see after the braces and halyards of the great sails; the two steersmen are below in the steerage; our captain, or the juragan, gives the course, guided pautly by the compass and partly by the direction of the wind, and a watch of two or three on the poop lowk atter the trimming of the sails and call out the honrs by the water-check. This is a very ingenious contrivance, which measures time well in buth rough weather
and fine. ' It is simply a bucket half filled with water, in which lloats the half of a well-scraped cocoa-nut shell. In the bottom of this shell is a very small hole, so tbat when phaced to float in the bucket a fine thread of water squirts up into it. This gradually fills the shell, aml the size of the hole is so adjusted to the capacity of the vessel that, exactly at the end of an hour, plump it goes to the bottom. The watch then cries out the number of hours from sumvise, and sets the shell afloat again empty. This is a very good measurer of time. I tested it with my watch and found that it hardly varied a minute from one hour to another, nor did the motion of the vessel lave any eflect upon it, as the water in the bucket of course liept level. It has a great auvantage for a rude people in loing easily understood, in being rather bulky and easy to see, and in the final submergence being accompanied with a little bubbling and commotion of the water, which calls the attention to it. It is also quickly replaced if lost while in harbour.

Our captain and owner I find to be a quict, goodtempered man, who seems to get on very well with all about him. When at sea he drinks no wine or spirits, but indulges only in coffee and cakes, morning and afternoon, in company with his supereargo and assistants. He is a man of some little education, can read and write well both Dutch and Malay, uses a compass, and has a chart. He has been a trader to Ara for many years, and is well known to both Europeans and natives in this part of the world.

Dec. $24 t h$ - Fine, and little wind. No land in sight for the first time since we left Macassar. At noon calm, with heavy showers, in which our crew wash their clothes, and in the afternoon the pratu is covered with shirts, trousers, and sarougs of various gay colours. I made a discovery to-dity which at first rather alarmed me. The two ports, or opeuings, through which the tillers enter from the lateral rudders are not more than three or four feet above the surface of the water, which thus has a free entrance into the vessel. I of cuurse had imagined that this open space from one side to the other was separated from the hold by a water-tight bulkhead, so that a sea entering
might wash out at the further side, and do no mere harm than give the steersmen a drenching. To my surprise and dismay, however, I find that it is completely open to the hold, so that hall-a-dozen seas rolling in on a stormy night wouhd nearly, or quite, swamp us. Think of a vessel going to sea for a month with two holes, each a yard square, into the hold, at three feet above the water-lineholes, too, which camot possibly he closed! But our captain says all praus are so; and though he acknowledges the danger, "he does not know how to alter it-the people ure used to it ; he does not understand praus so well as they do, and if such a great alteration were male, he aloould be sure to have difficulty in getting a crew!" This proves at all events that praus must be good sea-boats, for the captain has been continually making voyages in them for the last ten years, and says he has never known water enough enter to do any harm.

Dec. 25th.-Christmas-day dawned upon us with grasts of wind, driving rain, thunder and lightning, added to which a short conlused sea made our queer vessel pitch and roll very uncomfortably. About nine o'clock, however, it cleared up, and we then saw ahead of us the tine island of Bouru, perhaps forty or fifty miles distant, its mountains wreathed with clouds, while its lower lands were still invisible. The afternoon was fine, and the wind got round again to the west; but although this is really the west monsoon, there is no regularity or steadiness about it, calms and breezes from every point of the compass continually occurring. The captain, thongh nominally a Protestant, seemed to have no idea of Christmas-day as a festival. Oar dimer was of rice and curry as ussual, and an extra glass of wine was all I conld do to celebrate it,

Dec. 26th. - line view of the mountains of Bourn, which we have now approached considerably. Our crew seem rather a clumsy lot. They do not walk the deek with the easy swing of English sailons, but hesitate and stagger like landsmen. In the night the lower boom of our mainsail broke, and they were all the morning repairing it. It consisted of two bamboos lashed together thick end to thin, and was about seventy feet long. The rigring and armanement of these praus contrasts strangely
with that of European vessels, in which the various ropes and spars, thourh much more muntrous, are placed so as not to interfere with each other's action. Here the case is quite different; for though there are no shrouds or stays to complicate the matter, yet scaredy anything can be done without first cloaring sometling else out of the way. The large suils cannot be shifted round to go on the other tack without first hauling down the jibs, and the boons of the fore and aft satils have to be lowered and completely detached to perform the same operation. Then there are always a lot of ropes foul of each other, and all the sails can never be set (though they are so few) without a gioud part of their surface having the wind kept out of them by others. Yet praus are much liked even by those who have had Luropean vessels, bocause of their cheapness both in first cost and in keeping up; almost nill repairs can be done by the crew, and very few European stores are required.

Dec. 2 Sth. This day we saw the Banla group, the volcano first appearing, - a perfect cone, laving very much the outline of the Eqyptian pyranids, and looking alnost as regular. In the evening the smoke rested over its summit like a small stationary cloud. This was my first view of an active voleano, but pictures and panoramas have so impressed such things on one's mind, that when we at length behold then they seem nothing extraordinary.

Dec. $30 h$-Passed the island of Teor, and a group near it, which are very incorrectly marked on the charts. Flying-fish were numerous to-day. It is a sualler species than that of the Atlautic, and more active and elegant in its motions. As they skinu along the surface they turn on their sides, so as fully to display their beautul tins, taking a flight of ahout a hundred yards, rising and falling in a most gracelin manner: At a little distance they exactly resemble swallows, and no one who sees then can doubt that they really do dy, not merely descend in an oblique direction from the height they gain by then tirat spring. In the evening an aquatic bird, a species of hooby (Sula fiber.) rested in our hen-coop, and was caught by the neck by one of my boys.

Dec. 31st-At daybreak the Ked lslands (pronounced kay) were in sight, where we are to stay a few days. dhout noon we rounded the northern point, and endeavoured to coast along to the anchorage; bat heing now on the leeward side of the island, the wind eame in violent irremular gusts, and then leaving us altogether, we were carried back by a strong current. Just then two boatsload of natives appeared, and our owner having agreed with them to tow us into harhour, they tricd to do so, assisted by our own boat, but could make no way. We were therefore obliged to anchor in a very dangerons place on a rocky bottom, and we were engaged till nearly dark getting hawsers secured to some rocks under water. The coast of Ké along which we had passed was very picturesque. Light coloured linestone rocks rose abimptly from the water to the height of several hundred feet, everywhere broken into jutting peaks and pinnacles, weatherworn into sharp points and honeycombed surfaces, and clothed throughout with a most varied and luxuriant vegetation. The cliffs above the sea offered to our view serew-pines and arborescent Liliacese of strange forms, mingled with slurubs and creepers; white the higher slopes supported a dense growth of forest trecs. Here and there little bays ant inlets presented banches of dazzling whiteness. The water was transparent as crystal, and tinged the rock-strewn slope which plunged steeply into its unfathomble depths with colours varying from emerald to lapis-lazuli. The sua was culm as a lake, and the glorious sum of the tropics threw a Hood of golden light over all. The scene was to me irsexpressibly delightiful. I was in a new world, and could dyean of the wonderful productions lid in those rocky forests, and in those azure abysses. But fow European feet has ever trodden the shores I grazed upon; its plants, and nuimals, and men were alike almost mhnown, and I could not help speculating on what my wanderings there for a few days might bring to liglit.

# Chapter XXIX. 

TIIE KÉ ISI.ANDS.
(JANDART 1857.)

THE native boats that had come to mect us were three or four in number, containing in all about filty men. They were long canoes, with the bow and stern rising up iuto a beak six or eight feet high, decorated with shells and waving plumes of cassowaries hair. I now had my first view of Papuans in their own country, and in less than five minutes was convinced that the opinion alveady arrived at by the examination of a few Timor and New Guinea slaves was substantially correct, and that the people I now had an opportunity of comparing side by side belonged to two of the most distinct and strongly marked races that the earth contans. Haul I been blind, I could have been certain that these islanders were not Malays. The loud, rapid, eager tones, the incessant motion, the intense vital activity manfested in speech and action, are the very antipodes of the quiet, umimpulsive, unanimated Malay. These ké men came up singing and shouting, dipping their paddes deep in the water and throwing up clouds of spray; as they approached nearer they stood up in their canoes and increased their noise and gesticulations; and on coming alongside, without asking leave, and without a moment's hesitation, the greater part of them serumbled up on our deck just as if thry were come to take possession of a captured vessel. Then commenced a scene of indescribable confusion. These forty black, naked, mop-headed savages seemed intoxicated with joy and excitement. Not one of them could remain still fora a moment. Every individual of our crew was in tum sumponded and examined, asked for tobacco or arrack, grinnel at and deserted for another. All talked at once, and our captain was regulanly mobbed by the chief men, who wanted to be employed to tow us in, and who berged vociferously to be paid in advace. A few presents of tohaco made their eyes glisten; they
would express their satisfaction by grins and shouts, by solling on deck, ot by a headong leap overhourd. Schoulboys on an unexpected holiday, Irishmen at a fair, or midshipmen on shore, would give but a faint idea of the exuberant amimal enjoyment of these people.

Under similar circumstances Malays could not behave as these Papuans did. If they came on loard a vessel (after asking permission), not a word would be at first spoken, except a few compliments, and only after some time, and very cautiously, would any approach be made to business. One would speak at a time, with a low voice and great deliberation, and the mode of making a hargain would be by quietly refusing all your ofjers, or evell going away without saying another word about the matter, unless you advanced your price to what they were willing to accept. Out crew, many of whom had not made the royage before, seemed quite seandalized at such unprecedented bad maners, and only very gradually made any approach to fratermization witls the black fellows. They reminded me of a party of demure and well-behaved children suddenly broken in upon by a lot of wild romping, riotous boys, whose conduct seems most extraordinary and very naughty!

These moral features are more striking and more conclusive of alsolute diversity than even the physical contrast presented by the two races, though that is sufficiently remarkable. The sooty blackness of the skin, the nop-like hearl of frizzly lair, and, most important of all, the marked form of countenance of quite a different type from that of the Malay, are what we cannot believe to result from mere elimatal or other modifying influences on one and the same race. The Malay face is of the Mongolian type, broad and somewhat flat. The brows are depressed, the montly wide, but not projecting, and the nose small and well formed but for the great dilatation of the nostrils. The fite is smooth, and ravely develops the trace of a beard; the hair black, coarse, and perfectly straight. The Papuan, on the other hond, has a face which we may say is compressed and projecting. The brows are protuberant and overhanging, the mouth large and prominent, while the nose is very large, the apex elongated downwards, the ridge thick, and the nostrils lazge. It is an
obirnsive and remarkable feature in the countenance, the very reverse of what obtains in the Malay face. The twisted leard and frizaly hair complete this remarkable contrast. Here then I had rewhed a new word, inhabited by a strange people. Between the Malayan tribes, among whom I had for some years heen living, and the Paptan races, whose country I had now entered, we may firly say that there is as mueh diference, both moral and physiceil, as netween the red Indians of Sonth Ameriea and the negroes of Guinea on the "rowsite side of the Atlantic.

Jan. 1st, 1857.-This has been a day of thoroush enjeyment. I have wandered in the forests of an island rarely seen by Europeans. Before daybreak we left our andotage, and in an hour reached the village of Har, where we were to stay three or four days. The range of hills here receded so as to form a small bay, and they were broken up into preaks and hummocks with irtervening thats and hollows. $A$ broad beach of the whitest sand lined the inner part of the lay, backed by a mass of cocoa-mut palms, among which the huts were concealed, and surmounted by a deuse anl varied growth of timber. Canoes and boats of various sizes wore drawn up on the beach, and one or two idlers, with a few chiddren and a dog, gazed at our prau as we came to an anchor.

When we went on shore the first thing that attracted us was a large and well-constructed shed, under whieh a long boat was being built, while others in various stages of completion were placed at intervals along the beach. Our captain, who wanted two of moderate size for the trade among the islands at Aru, immediately began bargatuius for them, and in a short time load arranged the number of brass guns, gongs, sarongs, handkerchiefs, axes, white plates, tohacco, and arrack, which he was to give for a pair which could be got ready in for days. We then went to the village, which consisted only of three or four huts, situated immediately above the bench on an irregular rocky piece of ground overshadowed with coeon-nuts, palus, bananas, and other fruit trees. The houses were very rude, black and half rotten, raised a few feet on posts with low sides of bamboo or planks, and high thatehed roofs. They had small duors and no windows, an opening
under the projecting gables letting the smoke out and a little light in. Thre tioors were of strips of bambor, thin, slippery, and elastic, and so weak that my feet were in danger of plunging through at every step. Native boxes of pandanus-leaves and slabs of palm pith, very neatly constructed, mats of the same, jars and cooking pots of mative pottery, and a few Europen plates and basins, were the whole furniture, and the interior was throughout dark and snoke-hackened, and dismal in the extreme.

Accompanied by Ali and Baderoon, I now attempted to make some explorations, and we were followet by a train of boys eager to see what we were going to do. The most troddon path from the beach led us into a shady hollow, where the trees were of immense height and the undergrowth scanty. From the summits of these trees came at intervals a deep looming sound, which at first puzzled us, but which we soon found to proceed from some largo pigcons. My hoys shot at then, and after one or two misses, brought one down. It was a magnificent bird twenty inches long, of a bluish white colour, with the lack wings and tail intense metallic green, with golden, blue, and violet rellexions, the feet coral red, and the cyes gollen yellow. It is a rare species, which I have named Carpophaga concinna, and is found only in a few small islands, where, however, it abounds. It is the sane species which in the island of Banda is called the nutmeg-pigeon, from its habit of devouring the fruits, the seel or nutmeg being thrown up entire and uninjured. Though these pigeons have a narrow beak, yet their jaws and throat are so extensible that they can swallow fruits of very largo size. I had before shot a species much smaller than this one, which had a number of hard globular palm-fruits in its crop, each more than an inch in dimeter.

A little further the path divided into two, one leading along the beach, anil across mangrove and sayo swamps, the other rising to cultivated grounds. We theretive returned, and taking a fresh departure from the villace, endeavoured to assend the hills and penetrate into the interior: The path, however, was a most trying one. Where there was carth, it was a deposit of reddish clay
overlying the rock, and was worn so smooth by the attrition of naked feet that my shoes could obtain no hold on the sloping surface. A little farther we came to the bare rock, aud this was worse, fir it was so rugged and hroken, and so honeycombed and weatherworn into sharp points and angles, that my boys, who had gone barefooted all their lives, could not stand it. Their feet beran to bleed, and I saw that if I did not want then completely lamed it would be wise to turn baek. My own shoes, which were ratluer thin, were but a poor protection, and would som have been cut to pieces; yet our little naked guides tripped along with the greatest ease and unconcern, and seenect much astonished at our elfeminacy in not being able to take a walk which to them was a perfectly argreeable one. During the rest of our stay in the iskand we were obliged to confine ourselves to the wieinity of the shore and the cultivated grounds, and those more level portions of the forest where a little soil had iecumulated and the rock hat been less exposed to atmospheric action.

The island of $\mathrm{K} \in$ (pronomined exactly as the letter K . but erroneously spelt in our maps K cy or Ki ) is long and narrow, runnine in a north and south direction, and consists almost entirely of rock and mountain. It is everywhere covered with luxuriant forests, and in its bays aud inlets the sand is of dazzling whiteness, resulting from the decomposition of the coralline limestone of which it is entirely composed. In all the little swampy inlets ant valleys sacro trees abound, and these surply the main subsistence of the natives, who grow no rice, and have scaredy any other cultivated products hut cocoa-muts, plantains, and yaus. From the cocoa-muts, which surround every hut, and which thrive exceedingly on the porous linestone soil and under the influence of salt breezes, oil is made which is sold at a good price to the Aru traders, who all touch here to lay in their stock of this article, as well as to purchase boats and native crockery. Wooden bowls, paus, and trays are also largely made here, hewn out of solid blocks of wood with knife and adze; and these are carried to all rarts of the Molnceas. Put the art in which the natives of Fe pre-eminently excel is that of boatbuilding. Their forests supply abundance of tine timber,
though probably not more so than many other islands, and from some unkown auses these renote sumates have come to excel in what secms a very dillicult art. Their small canoes are beantifully formed, broad and low in the coutre, lout rising at each end, where they terminate in high-pointed beaks more or less carved, and ornameated with a plume of feathers. They are not hollowed out of a tree, but are remulary built of planks ruming trom end to end, aud so nccurately fitter that it is oftem ditieult to fimd a place where a binife-blade can be inserted botwecon the juints. The larger ones are from 20 to 30 tons burthen, and are finished ready fir sea without a nail or particle of iron being used, and with mor other tools than axe, adze, and auget. These vessels are landsome to lonk at, good sailers, and admitable sea-boats, and will make long voyages with perfect safety, thaversing the whole Archipelago from New Guinea to Singapore in seas which, as every one who has sailed moth in them can testify, are not so smooth and tempest free as word-painting travellers love to represent them.

The forests of Ké produce magnifient timber, tall, straight, aud durable, of various qualities, some of which are said to be superior to the best Indian teak. To make each puir of planks used in the construction of the larger boats an entire tree is consumed. It is felled, often miles away from the shore, cut across to the proper length, and then hewn longitudinally into two equal portions. Each of these forms a plank hy cutting down with the axe to a uniform thickness of three or four inches, leaving at first a solid block at each end to prevent splitting. Along the centre of each plank a series of projecting pieces are left, standing up three or funr inches, about the same width, and a foot long; these are of great importance in the construc. tion of the vessel. When a sufficient number of planks have been made, they are laboriously thagged through the forest by three or four mon each to the beach, where the boat is to be built. A fomudation piece, broad in the middle and rising considerahly at each end, is first laid on blocks and properly shored up. The edges of this are worked true and smooth with the adze, and a plank, properly eurved and tapering at each end, is held firmly up
against it, while a line is struck along it which allows it to be cut so as to fit exactly. A series of anger luples, about as large as one's finger, are then bored along the opposite edges, and pins of very hand wood are fitted to these, so that the two planks are leed firmly, and can be driven into the closest contact ; and difficult as this seems to do withont any other aid than rude practical skill in forming each elge to the true eorresponding curves, and in boring the holes so as exactly to match both in position and direction, yet so well is it done that the best Euronean shipwright cannot produce sounder or closer-fitting juints. The boat is bnilt up in this way by filting plank to plank till the proper height and width are oltamed. We have now a skin held together entirely by the laadwood pins comecting the edges of the platis, very strong and elastie, but having nothing but the adhesion of these pins to prevent the planks gaping. In the smaller hoats seats, in the larger ones coss-beams, are now fixed. They are sprugg into slight notches cut to receive them, and are further secured to the projecting pieces of the plank below hy a strong lashing of rattan, Ribs are now formed of single pieers of tough wood chosen and trimmed so as exactly to fit on to the projections from each plank, being slightly notched to receive then, and securely bound to them by ratans passed through a bole in each projecting piece close to the surface of the plank. The ends are closed ngainst the vertical prow and stern posts, and further secured with pegs and rattans, and then the boat is complete; and when fitted with rudders, masts, aud thatched covering, is ready to do hattle with the waves. A careful consideration of the principle of this mode of emstruction, and allowing for the strength and binding qualities of rattan (which resembles in these respects wire rather than cordage), makes me believe that a vessel carefully built in this manner is actually stronger and safer than one fastened in the ontinary way with nats.

During our stay here we were all very busy. Our captain was daily superintending the completion of his two small praus. All day loug native boats were coming with fish, cocoa-nuts, parots and lories, earthen pans, sirip leaf, wooden bowls, and trays, \&c. de, which every
one of the fifty inhabitants of our pran seemed to be buying on his own account, till all available and most unavailable space of our vessel was ocenpied with these miscellaneous articles: for every man on board a prau considers himself at liberty to trade, and to carry with him whatever he can afford to buy.

Money is unknown and valueless here-knives, cloth, and arrack forming the only modium of exchange, with tobacco for small coin. Every transaction is the sulject of a special bargain, and the cause of much talking. It is absolutely necessary to offer very little, as the natives are never satisfied till you add a little more. They are then far better pleased than if you had given them twice the amount at first and refused to increase it.

I, too, was doing a little business, having persuaded some of the natives to collect insects for rue; and when they really tound that I gave them most fragrant tobacco for worthless black and green beetles, I soon lad scores of visitors, men, women, and children, bringiug bamboos full of creeping things, which, alas! too frequently had eaten each other into fragments during the tedium of a day's confinement. Of one grand new beetle, glittering with ruby and emerald tints, I got a large quautity, baving first detected one of its wing-cases ornamenting the outside of a native's tobacco pouch. It was quite a new species, and had not been found elsewhere than on this little island. It is one of the Buprestide, and has been named Cyphogastra calepyga.

Each morning after an early breakfast I wandered by myself into the forest, where I found delightful occupation in capturing the large and handsome butterfies, which were tolerably abundant, and most of them new to me; for I was now upon the confines of the Moluceas and New Guinea,-a region the productions of which were then among the most precious and rare in the cabincts of Europe. IIere my eyes were feasted for the first time with splendid scarlet lories on the wing, as well as by the sight of that most imperial butterfly, the "Priamus" of collectors, or a closely allied species, but flying so high that I did not succeed in capturing a specimen. One of them was brought me in $a$ bamboo, boxed up with a lot of
beetles, and of course torn to pieces. The principal drawback of the place for a collector is the want of good paths, and the dreadfully rugged character of the surface, requiring the attention to be so contioually directed to securing a footing, as to make it very difficult to capture active winged things, who pass out of reach while one is glancing to see that the next step may not plunge one into a chasm or over a precipice. Another inconvenience is that there are no running streans, the rock being of so porous a nature that the surface-water everywhere penetrates its fissures; at teast such is the character of the neighbourhood we visited, the only water being small springs trickling ont close to the sea-beach.

In the forests of Ké, arboreal Liliacee and Pandanacea abound, and give a character to the vegetation in the moro exposed rocky places. Flowers were scarce, and there were not many orchils, but I noticed the fine white butterfly-orchis, Phalenopsis grandittora, or a species closely allied to it. The freshmess and vigour of the vegetation was very pleasing, and on such an arid rocky surface was a sure indication of a perpetwally humid climate. Tall clean trunks, many of them buttressed, and immense trees of the fig family, with aerral roots stretching out and iuterlacing and matted together for filty or a hundred feet above the ground, were the characteristic features; aud there was an alosence of thorny slumbs and prickly rattaus, which would have made these wilds very pleasant to roam in, had it not been for the sharp honeycombed rocks already alluded to. In damp places a fine undergrowth of broad-leaved herbaceous plants was found, about which swarmed little green lizards, with tails of the most "heavenly blue," twisting in and out numong the stalks and foliage so actively that I often caught glimpses of their tails only, when they startled me by their resemblance to small snakes. Almost the only sounds in these primeval woods proceeded from two birds, the red lories, who utter shrill screams like most of the parrot tribe, and the large green nutmeg-pigeon, whose voice is either a lond and deep boom, like two notes struck upon a very large gong, or sometimes a harsh toad-like croak, altogether pecular and remarkable. Only two quadrupeds are said
by the natives to inhabit the island-a wild pig and a Cascus, or Eastern opossum, of neither of which could I obtain specimens.

The insects were more abundant, and very interesting. Of buttertlies I caught thirty-five species, most of them new to me, and many quite unknown in European collections. Among them was the fine yellow and black Papilio euchenor, of which but few specimens had been previously captured, and several other hamlsome butterlies of large size, as well as some beautiful little "blues," and some brilliant day-flying moths. The bectle tribe were less abundant, yet I obtained some very fine and rare species. On the leaves of a slender shrub in an old clearing I found several fine blue and black beetles of the gemus Eupholus, which almost rival in beauty the diamond beetles of South America. Some coton-nut palms in blossom on the beach were frequented by a fine green flotal beetle (Lomaptera papur), which, when the flowers were shaken, flew off like a small swarm of bees. I got one of our crew to elimb up the tree, and he bronght me a good number in his hand; and seeing they were valuable, I sent lim up again with my net to shake the flowers into, and thus secured a large quantity. My best capture, however, was the superb insect of the Buprestis family, already mentioned as laving been oltained from the natives, who told me they found it in rotten trees in the mountains.
ln the forest itself the only common and conspicuous coleoptera were two tiger beetles. One, Therates labiata, was much larger than our green tiger beetle, of a purple black colour, with green metallic glosses, and the broad upper lip of a bright yellow. It was always found upon toliage, generally of broad-leaved herbaceous plants, and in damp and gloomy situations, taking frequent short flights from leaf to leaf, and preserving an alert attitude, as if always looking out for its prey. Its vicinity could be immediately ascertained, often before it was seen, by a very pleasant odour, like otto of roses, which it seems to emit continually, and which may probally be attractive to the small insects on which it feeds. The other, Tricondyla aptera, is one of the most curious forms in the family of the Ciendelide, and is ahost exclusively confined to the

Malay islands. In shape it resembles a very lare ant, more than an inch long, and of a purple lhack colour, Like an ant also it is wingless, and is generatly found ascending trees, passing around the trunks in a spiral direction when approached, to avoid capture, so that it requires a sudden run and active fingers to secure a specimen. This species emits the usual fetid odome of the ground beetles. My collections during our four days stay at Ké were as follow:-Birds, 13 species; insects, 194 species; and 3 kinds of land-shells.

There are two kinds of people inhabiting these islands -the indigenes, who have the Papuan chatacters strongly marked, and who are pagans; and a mixed race, who are nominally Mahometans, and wear cotton clothing, while the former use only a waist cloth of cotton or bark. These Mahometans are said to have been driven out of Banda by the early European settlers. They were probably a brown race, more allied to the Malays, and their mixed descendants here exhibit great variations of colour, hair, and features, graduating between the Malay and Papuan types. It is interesting to observe the inflnence of the early Portughese trade with these countries in the words of their language, which still remain in use even among these remote and savage istanders. "Lenço" for handkerchief, and "faca" for knite, are here used to the exclusion of the proper Malay terms. The Portuguese nod Spauiards were truly wonderful conquerors and colonizers. They effected more rapid changes in the comntries they conquered than any other nations of modern times, resembling the Romans in their power of impressing their own language, religion, and manners on rude and barbarous tribes.

The striking contrast of character between these people and the Malays is exemplified in many little traits. One day when I was rambling in the forest, an old man stopped to look at me catching an insect. He stood very quiet till I had pinned and put it away in my collecting box, when he could contain himself no longer, but bent almost, double, and enjoyed a hearty roar of laurhter. Every one will recognise this as a true negro trait. A Malay would have stared, and asked with a tone of bewilderment what I was doing, for it is lut little in his nature to laugh,
never heartily, and still less at or in the presence of a stranger, to whom, however, his disdainful slances or whispered remarks are less agreeable than the most hoisterous open expression of merrinent. The women here were not so much frightened at strangers, or made to keep themselves so much secluded as anong the Malay races; the children were more merry and had the "nigger grin," while the woisy confusion of tongues among the men, and their excitement on very orlinary occasions, are altogether removed from the general taciturnity and reserve of the Malay.

The language of the Ké people consists of worls of one, two, or three syllables in about equal proportions, and has many aspirated and a few guttural sounds. The ditferent villages have slight differences of dialeet, but they are mutually intelligible, and, except in words that have evidently been introduced during a long-continued commercial intercourse, seem to have no affinity whatever with the Malay languages.

Jon. 6 th.-The small boats being finished, we sailed for Aru at 4 P.M., and as we left the shores of Ké had a fine view of its rugged and mountainous character; ranges of hills, three or four thousand feet high, stretching southwards as far as the eye could reach, everywhere eovered with a lofty, dense, and unbroken forest. We had very light winds, and it therefore took us thirty hours to make the passage of sixty miles to the low, or flat, but equally forest-covered Aru Islands, where we anchorel in the harbour of Dobbo at nine in the evening of the next lay.

My first voynge in a prau being thus satisfactorily terminated, I must, before taking leave of it for some months, bear testimony to the merits of the queer oldworld vessel. Setting aside all ideas of danger, which is probably, after all, not more than in any other craft, I must declare that I have never, either before or since, made a twenty days' voyage so pleasantly, or perhaps, more correctly speaking, with so little aiscomfort. This I attribute chiefly to having my small cabin on deck, and entirely to myself, to having my own servants to wait upon me, and to the absence of all those marine-store smells of paint, pitch, tallow, and new cordage, which are
to me insupportable. Something is also to be put down to freedom from all restraint of dress, hours of meals, \&c., and to the civility and obliging disposition of the captain. I had agreed to have my meals with him, but whenever I wished it I had them in my own berth, and at what hours I felt inclined. The crew were all civil and goodtempered, and with very little discipline everything went on smoothly, and the vessel was kept very clean and iu pretty good order, so that on the whole I was much delighted with the trip, and was iuclined to rate the luxuries of the semi-barbarous prau as surpassing those of the most magnificent scrow-steamer, that highest result of our civilization.

## CHAPTER XXX.

## THE ARU ISLANDS.-RESIDENCE IN DOBBO.

(JaNUARY to mardi 1857.)

0N the 8th of January, 1857, I landed at Dobbo, the trading settlement of the Bugis and Chinese, who annually visit the Aru Islands. It is situated on the small island of Wamma, upon a spit of saud which projects out to the north, and is just wide euough to contain three rows of houses. Though at first sight a most strange and desolate-looking place to build a village on, it has many advantages. There is a clear entrance from the west among the coral reefs that border the land, and there is good anchorage for vessels, on one side of the village or the other, in both the east and west monsoons. Being fully exposed to the sea-breezes in three directions it is healthy, and the soft sandy beach offers great facilities for hauling ap the praus, in order to secure them from sea-worms and prepare them for the homeward voyare. At its southern extremity the sand-bank merges in the beach of the island, and is backed by a luxuriant growth of lofty forest. The bouses are of various sizes, but are all built after one pattern, being merely large thatched
sheds, a small portion of which, next the entrance, is used as a dwelling, while the rest is parted off, and often divided by one or two floons, in order better to stow away merchandise and native produce.

As we had arrived early in the season, most of the honses were empty, and the place looked desolate in the extreme-the whole of the inhabitants who received us ou our landing amounting to alout half-a-dozen Bugis amb Chinese. Our captain, Herr Warzbergen, had promised to ohtain a loonse for me, that unforeseen ditliculties presented thenselves. One which was to let lad no roof, and the owner, who was building it on speculation, could not promise to linish it in less than a month. Another, of which the owner was deal, and which I might therefore take undisputed possession of as the first comer, wanted considerable repairs, and no one could he found to do the work, alhough about four times its value was offered. The captain, therefore, recommented me to take possession of a jretty grod house near his own, whose owner was not expected for some weeks; and as I was auxious to be on shore, I immediately lad it cleared out, and by evening had all my things housed, and was regularly installed as an inhabitant of Bobbo. I haul brought with me a cane chair, and a few light boards, which were soon rigged up into a talle and shelves. A broad bamboo bench served as sofa and bedsteal, my loxes were conveniently arrangel, my mats spread on the hloor, a window cut in the palm-leaf wall to light my table, and though the place was as miserable and gloomy a shed as could be imagined, I felt as contented as if I had obtained a well-furnished mansion, and looked forward to a month's residence in it with unmixed satisfaction.

The next morning, after an early breakfast, I set off to explore the virgin forests of Aru, anxious to set my mind at rest as to the treasures they were likely to yield, and the probable success of my long-meditated expedition. A little native imp was our guide, seduced by the gift of a German kuife, value three-halipence, and my Macassar boy Baderoon brought his chopper to clear the path if necessary.

We hal to walk about half a mile along the beach, the
ground behind the village being nostly swampy, and then turned into the forest along a path which leads to the native village of Wamma, about three miles off on the other side of the island. The path was a narrow one, and very little used, often swampy and obstructed by fatlen trees, so that after about a mile we lost it altugether, our gude having turned back, and we were obliged to follow his example. In the menntime, however, I had not heen idle, and my day's captures determined the success of my journey in an entomologrical point of viow. I had taken about thirty speeies of butterthes, more than I had exer captured in a day since leaving the prolific bans of the Amazon, and among them were many most rare and beautilul insects, hitherto only known hy a few specimens from New Guinea. The large and haulsome spectrebutterlly, Hestia durvillei; the pale-winged peacock butterfly, Drusilla catops; and the most brilliant and wonderful of the clear-winged moths, Coevtia d'Urvillei, were especially interesting, as well as several little "blues," equalling in brilliancy and beaty anything the butterfly world can produce. In the other groupis of insects I was not so successful, lut this was not to bee wondered at in a mere exploring mambe, when only what is most conspicuous and novel attracts the attention. Several pretty beetles, a superb" bug," and a few nice land-shells were obtained, and I retumed in the afternoon well satisfied with my first trial of the promised land.

The next two days were so wet and windy thast there was no going out; but on the succeeding one the sun shone brightly, and I had the good fortune to capture one of the most magnificent insects the world contains, the great birlwinged butterfly, Ornithoptera posedlon. I trembled with excitement as I saw it coming majestically towards me, and could hardly believe I hat really succeeded in my stroke till I lad taken it out of the net and was gazing, lost in admiration, at the velvet black and brilliant green of its wings, seven inches across, its golden body, and crimson loreast. It is true I had seem similar insects in cabincts at home, but it is quite another thing to capture such oneself-to feel it struggling between one's fingers, and to gaze upon its fresla and living beaty, a bright gem
shining out amid the silent gloom of a dark and tangled finest. The village of Dobbo held that evening at least one contented man.

Jan. 26th.-Having now been here a fortnight, I began to understand a little of the place and its peculiarities, 1raus continually arrived, and the merchant population increased almost daily. Every two or three days a fresh house was opened, and the necessary repairs made. In every direction men were bringing in poles, bamboos, rattans, and the leaves of the nipa palm to construct or repair the walls, thateh, doors, and shutters of their honses, which they do with great celerity. Some of the arivals were Maenssar men or Bugis, but more from the small ishat of Goram, at the east end of Ceram, whose inlubitants are the petty traders of the far Last. Then the natives of Aru come in from the other side of the islands (called here "blakang tana," or "lack of the country") with the produce they have collected during the preceding six months, and which they now sell to the traders, to some ol whom they are inust likely in debt. Almost all, or I may sately say all, the new arrivals pay me a sisit, to see with their own eyts the unheard-of pheuomenon of a person come to stay at Dobbo who does not trade: They have their own indeas of the uses that may Imssibly le made of stulted binds, beetles, and shells which are not the right shells - that is, " mother-of-pearl." They every day bring me dead and broken shells, such as I can pick up, by hundreds on the beach, and seem quite puzaled and distressed when I dechine them. If, however, there tre any snail shells among a lot, I take them, and ask for more-a principle of selection so utterly untitelligible to them, that they give it up in despair, or solve the problem by imputing hidden medieal virtue to those which they see me preserve so carefully.

These traders are all of the Malay race, or a mixture of which Malay is the chief ingredient, with the exception of a lew Chinese. The natives of Ant, on the other hamd, are Pupuans, with black or sonty brown skins, woolly or frizzly hair, thick-ridged prominent noses, and rather slender limbs. Nost of then wear nothing but a waistcloth, and a few of them may be seen all day long wan-
dering about the half-deserted streets of Dobbo offering their little bit of merehandise for sale.

Living in a trader's house everything is brought to me as well as to the rest,-bundles of smoked tripang, or "beche de mer," looking like sansages which have been rolled in mud and then thrown up the chimney; dried sharks' fins, mother-of-pearl shells, as well as Birds of E'aradise, which, however, ate so dirty and so badly preserved that I have as yet found no specimens worth purchasiug. When I hardly look at the articles, and make no offer for them, they seen incredulous, and, as if fearing they have misunderstood me, again offer them, and declare what they want in return -knives, or tobacco, or sago, or handkerchiefs. I then have to endeavour to explain, through any interpreter who may be at hand, that neither tripang nor pearl oyster shells have any charms for me, and that I even decline to speculate in tortoiseshell, but that anything eatable I will buyfish, or turtle, or vegetables of any sort. Almost the only fooll, however, that we can obtain with any regularity, are fish and cockles of very good quality, and to supply our daily wants it is absolutely necessary to be always provided with four articles-tobacco, knives, sago-cakes, and Dutch copper doits-because when the particular thing asked for is not forthcoming, the fish pass on to the next house, and we may go that day without a dinner. It is curions to see the baskets and buckets used here. The cockles are brought in large volute shells, probably the Cymbium ducale, while gigantic helmet-slells, a species of Cassis, suspended by a rattan handle, form the vessels in which fresh water is daily carried past my door. It is painful to a naturalist to see these splendid shells with their inner whonls ruthlessly broken away to fit them for their ignoble use.

My collections, however, got on but slowly, owing to the unexpectedly bad weather, violent winds with heavy showers having been so continuous as only to give me four good collecting days out of the first sixteen 1 spent here. Yet enough had been collected to show me that with time and fine weather I might expect to do something good. From the natives I obtained some very fine insects and at few pretty land-shells; and of the small number of birds
yet shot more than hall were known New Guinea species, ant therefore certainly rare in European collections, while the remander were probatly new. In one respect my hopes seemed doomed to be disappointed. I hand anticipated the plensure of myself preparing fine specimens of the Sinds of Paradise, but I now laant that they are all at this season out of planage, and that it is in September and October that they have the long plames of yellow silky fathers in lull perfection. As all the praus return in July, I shouhl not be able to spend that season in Aru withont remaining another whole yoar, which was out of the question. I was informed, however, that the small red species, the "King Bird of I'madise," retains its phamge at atl seasons, and this 1 might therefore liope to get.

As I becane fimiliar with the forest scenery of the island, 1 lerecived it to possess some characteristic teat ures that distingushed it from that of lomeo and Malacea, while, what is very sugular and iuteresting, it recalled to my mind the halt-furgotten inmuressions of the forcsts of Equatorial America. For exauple, the palas were much more abundant than I had generally foumd them in the Jast, more generally mingled with the other vegetation, more varied in form and aspect, and presenting some of those lolty and majestic smooth-stemmed, pimate-leaved species which recall the Uathassú (Attalea speciosa) of the Amazon, but which I had hitherto rarely met with in the Malayan islands.

In anmal life the immense number and variety of spiders and of lizards were ciremmstances that recalled the prolitic regions of South America, more especially the abuodance and varied colours of the litule jumpinger spiders which abound on flowers and folisge, aud are ulten perfoet geus of beauty. 'The web-spioning species were also more numerous than I had ever seen them, and were a great annoyance, stretching their nets across the bootpaths just abont the height of my face; and the thereats compusing these are so strong and glutinous as to require much trouble to free oneself from them. Then their inhabitants, great yellow-spotted monsters with bodies two inches long, and legs in proportion, are not pleasant thiugs to run one's nose against while pursuing some gorgeous butterly, on gazing
aloft in search of some strange-voiced bird. I soon found it necessary not only to lrush away the web, but also to destroy the spinner for at first, having cleared the path one day, I found the next morning that the industrions insects hail spread their nets again in the very same places.

The lizards were equally strikiug by their numbers, variety, and the situations in which they were found. 'lhe beautiful blue-tailed species so abundant in Ke , was not seen here. The Aru lizards are more varied but more sombre in their colours-shades of greeu, grey, brown, and even black, leing very frequently seen. Every shrub and herbaceous plant was alive with them, every rotten trunk or dead branch served as a station for some of these active little insect-hunters, who, I fear, to satisfy their gross appetites, destroy many gems of the insect world, which would feast the eyes and delight the heart of our more discriminating entomologists. Another curious feature of the jungle here was the multitude of sea-shells everywhere met with on the ground and high up on the branches and foliage, all inhabited by hermit-crabs, who forsake the beach to wander in the forest. I have actually seen a spider carrying away a goud-sized shell and devouring its (probably juvenile) tenant. On the beach, which I had to walk along every morning to reach the forest, these creatures swarmed by thousands. Every dead shell, from the largest to the most minute, was appropriated by them. They formed suall social parties of ten or twenty around bits of stick or seaweed, but dispersed hurriedly at the sound of approaching footsteps. After a windy night, that nasty-looking Chinese delicacy the sea-slug was sometimes thrown up on the beach, which was at such times thickly strewn with some of the most beautiful shells that adorn our cabinets, along with fragments and masses of coral and strange sponges, of which I picked up more than twenty different sorts. In many cases sponge and coral are 50 much alike that it is only on touching theme that they ean be distinguished. Quantities of seaweed, Lou, are thrown up; but strange as it may seem, these are fat less beautiful and less varied than may be found on any favourable part of our own coasts.

The natives here, even those who seem to be of pure

Papuan race, were much more reserved and taciturn than those of Ke. This is probably because I ouly saw them as yet among strangers and in small parties. One mast see the savage at home to know what he really is. Lyen here, however, the Papuan character sometimes breaks out. Little buys sing cheerfully as they walk along, or talle aloul to themselves (quite a negro characteristic) ; and, try all they can, the men cannot conceal their emotions in the true Malay fashon. A number of them were one day in my house, and having a fancy to try what sort of eating tripang would be, I bought a couple, paying for them with such an extravagant quantity of tobaceo that the seller saw I was a green customer. He coull not, however, conceal his delight, but as he smelt the fragrant weed, and exhibited the large handful to his companions, he grimned and twisted and gave silent chuckles in a most expressive pantomime. I had olten before made the same mistake in paying a Malay for some tritle. In no case, however, was his pleasure visible on his countenance-a dull and stupid hesitation only showing his surprise, which would be exhibited exactly in the same way whether he was over or under paid. These little moral traits are of the greatest interest wheu taken in connexion with physical features. They do not admit of the same ready exphanation by external causes which is so frequently applied to the latter. Writers on the races of mankind have ton often to trust to the information of travellers who pass rapidly from country to country, and thus have few opportunities of lecoming adquainted with peenliarities of national chat meter, or even of ascertaining what is really the averago physical contormation of the people. Sucla are exceedingly apt to be deceived in places where two races have long intermingled, by looking on intermediate forms and mixed habits as evidences of a natural transition lrom one race to the other, instead of an artificial mixture of two distinet peoples; and they will be the more remdily led into this error if, as in the present case, writers on the subject should have been in the habit of classing these races as mere varieties of one stock, as closely related in physical conformation as trom their geographical proximity one might suppose they ought to be. So far as I have jei
seen, the Malay and Papuan appear to be as widely separated as any two human races that exist, being distinguished by physical, mental, and moral charucteristics, all of the most marked and striking kind.

Feb. 5th.-I took advantage of a very fine calm day to pay a visit to the island of Wokan, which is about a mile from us, and forms part of the "tanna busar," or mainland of Aru. This is a large island, extending from north to south alout a hundred miles, but so low in many parts as to be intersected by several creeks, which run completely through it, offering a passage for good-sized vessels. On the west sido, where we are, there are only a few outlying islands, of which ours (Wamma) is the principal; but on the east const are a great number of islands, extending some miles beyond the mainland, and forming the "blakang tana," or "back country," of the traders, being the principal seat of the pearl, tripang, and fortoiseshell fisheries. To the mainland many of the birds and animals of the country are altogether contined; the Birds of l'aradise, the black cockatoo, the great brushturkey, and the cassowary, are none of them found on Wamma or any of the detached islands. I did not, however, expect in this excursion to see any decided difference in the forest or its productions, and was therefore acreeably surprised. The beach was overhung with the troopirg braches of large trees, loaded with Orchidere, ferns, and other epiphytal plants. In the forest there was more varicty, some parts being dry, and with trees of a lower growth, while in others there were some of the most beautiful palms I have ever seen, with a periectly struight, smooth, slemeler stem, a humbed feet high, and a crown of handsome drooping leaves. liut the greatest novelty and most striking feature to my eyes were the tree-ferns, which, after seven years spent in the tropics, I now saw in perfection for the first time. All I had hitherto met with were slender species, not more than twelve feet high, and they gave not the least idea of the supreme beaty of trees bearing their elegant heads of fronds more than thirty feet in the air, like those which were plentifully scattered about this forest. There is nothing in tropical vegetation so perfectly beautiful.

My boys shot five sorts of birds, none of which we had obtained during a month's shooting in Wamma. 'Two were very pretty fyentchers, already known from New Guinea ; one af them (Monareha chrysomela), of brilliant black and bright orange colours, is ly some authors considered to he the most beantiful of all flycatehers; the other is pure white and velvety black, with a broad fleshy ring rouml the eye of an azure blue colour ; it is named the "spectacled flyeatcher" (Monarcha telescopthalma), and was first found in New Guinen, along with the other, by the Freach naturalists during the voyage of the dis-covery-ship Coquille.

Feh. 18th. - Before leaving Macassar, I had written to the Governor of Amboyna requesting him to assist me with the native chicfs of Aru. I now received by a vessel which had arrived from Amboyna a very polite answer, informing me that orders had been sent to give me every assistance that I might require; and I was just congratulating myself on being at length able to get a boat and men to go to the mainland and explore the interior, when a sudden cheek came in the form of a piratical incursion. A small prau arrived which had been attacked by pirates aud had a man wounded. They were said to have five loats, but more were expected to be behind, and the traters were all in consternation, fearing that their small vessels sent trading to the "blakang tana" would be plundered. The Aru natives were of course dreadfully alarmed, as these maraders attack their villages, hurn and murder, and carry away women and children for slaves. Not a man will stir from his village for some time, and I must remain still a prisoner in Dobbo. The Governor of Amboyna, out of pure kindness, has told the chiefs that they are to be responsible for my safety, so that they have an excellent excuse for refusing to stir.

Several praus went out in search of the pirates, sentinels were appointed, and watch-fires lighted on the beach to guard ayainst the possibility of a night attack, though it was hardly thought they would be bold enough to attempt to plunder Dobbo. The next day the praus returned, and we had positive information that these scourges of the

Eastern seas were really among us. One of Merr Warzbergen's small praus also arrived in a sad plight. It had been attacked six days before, just as it was returning from the "blakang tana." The crew escaped in their small hoat and hid in the jungle, while the firates came up and plundered the vessel. They took away everything but the cargo of mother-of-pearl shell, which was too bulky for them. All the clothes and boxes of the mea, and the sails and cordage of the prau, were cleared off. They had four large war boats, and fired a volley of musketry as they came up, and sent off their small boats to the attack. After they hau left, our men ouserved from their concealment that three had stayed hehimel with a suall boat; and being ariven to desperation lyy the sight of the plundering, one brave fellow swam olf armed only with his parang, or chopping-knife, and coming on them unawares made a desperate attack, killing one and womeding the other two, receiving himself numbers of slight wounds, and then swimming olf again when almost exhansted. Two other mans were also plundered, and the crew of one of them murdered to a man. They are said to be Souloo piates, but have Bugis among them. On their way here they have devastated one of the small islands enst of Ceram. It is now eleven years since they have visited Aru, and by thus making their attacks at long and uncertain intervals the alarm dies away, and they find a population for the nost part unarmed and unsuspicious of danger. None of the small traling vessels now carry anms, though they did so for a year or two after the last attack, which was just the time when there was the least occasion for it. A week later one of the smaller pirate honts was captured in the "bakang tana." Seven men were killed and three taken prisoners. The larger vessels have been often seen lut canot be caught, as they have very strong erews, and can always escape by rowing out to sea in the eye of the wind, retuming at night, They will thus remain among the inmmerable islands and chamels, till the change of the monsoon enables them to sail westward.

March 9th.-For foll or five days we have had at continual gale of wind, with occasional grosts of great fury,
which seem as if they would send Dobbo into the sea. Rain accompanies it ahonst every alternate hour, so that it is not a pleasant time. During such weather I can do little, but am busy getting realy a boat I have purchased, for an excursion into the interior. There is immense difficulty about men, but I believe the "Orang-kaya," or head man of Wamma, will accompany me to sce that I don't run into danger.

Having become quite an old inlabitant of Doblo, I will endeavonr to sketch the sights and sounds that pervade it, and the manners and customs of its inhabitants. The phace is now pretty full, and the streets present a far more cheerfal aspect than when we first arrived. Every house is a store, where the natives barter their produce for what they are most in need of. Knives, choppers, swords, guns, tobacco, gambier, plates, basins, landkerchiefs, sarongs, calicoes, and arrack, are the principal articles wanted by the natives; but some of the stores contain also tea, coffee, sugar, wine, biscuits, \&c., for the sapply of the traders; and others are full of fancy goods, chma ormaments, lookingglasses, razors, umbrelias, pipes, and purses, which take the fancy of the wealthier natives. Every fine day mats are spread before the doors and the tripang is put out to dry, as well as sugar, salt, biscuit, tea, cloths, and oilher things that get injured by an excessively moist atmosphere. In the morning and evening, spruce Chimamen stroll about or chat at each other's doors, in blue trousers, white jacket, and a queue into which red silk is plaited till it reaches almost to their heels. An old Bugis hadji regularly takes an evening stroll in all the digmity of flowing green silk robe and gay turban, followed by two small boys carrying his sirib and betel boxes.

In every vacant space new houses are being built, and all sorts of odd little cooking-sheds are erected against the old ones, while in some out-of-the-way corners, massive $\log$ pigsties are tenanted ly growing porkers; for low could the Chinamen exist six months without one feast of pig? Here and there are stalls where bananas are sold, and every morning two little boys go about with trays of sweet rice and grated cocoa-nut, fried fish, or fried plantains; and whichever it may be, they have but one cry, and that is-
"Chocolat-t-t!" This must be a Spanish or Portugnese cry, handed down for centuries, while its meaning las ben lost. The Bugis sailors, while hoisting the mainsaỉl, cry out, "Vēla it vèla,-vóla, véla, vèla!" repeated in an everlasting chorus. As "velu" is Portugnese for a sail, I supposed I had discovered the origin of this, but I found afterwards they used the same cry when heaving anchor, and often changed it to "hela," Which is so muth an miversal expression of exertion and hard hreathing that it is most probally a mere interjectional cry.

I datesay there are now near five humbed penple in Dobbo of various races, all met in this remote comer of the East, as they express it, "to look for their fortune;" to get money any way they can. They are most of them people who have the very worst reputation for honesty as well as every other form of morality,-Chinese, Buyis, Ceranese, and half-caste Javanese, with a sprinkling of half-wid l'sphans from Timor, Babber, and other islands, yet all goes on as yet very quietly. This motley, imnorant, bloodthirsty, thievish population live here withont the shaulow of a govemment, with no police, no courls, and no lawyers; yet they do not cut each other's throats, do not phunder each other day and night, do not fall into the amarchy such a state of things mbith be supposed to lead to. It is very extraordinary I It puts straure thoughts into one's head ahout the mountain-load of goverument unter which peophe exist in Europe, and surgests the idea that we may be overgovernal. Think of the hundred Aets of Parliament anmually enncted to prevent us, the people of England, from cutting each other's throuts, or from doing to our neighbour as we would not be done by. Think of the thonsands of lawyers and harristers whose whole lives are spent in telling us what the hundred Acts of Parliament nean, aml one wond be led to infor that if Dobluo has too little law Englatud has too much.

Here we may lehold in its simplest form the genius of Commerce at the work of Civilization. Trade is the magie that kemps atl at peace, aul unites these discordant chements into a well-behaved community. A!! are traders, and sall
know that peace and orler are essential to successful trade. and thus a public opinion is created which puts down all lawlessness. Often in former years, when strolling along the Campong Glam in Singapore, I have thought how wild and ferocious the litgis sailors looked, and how little I should like to trust myself among them. But now I find them to be very decent, well-behaved fellows; I walk daily unarmed in the jungle, where I meet them contimually; I sleep in a palm-leaf hut, which any one may enter, with as little fear and as little danger of thieves or murder as if I were under the protection of the Metropolitan police. It is true the Dutch influence is felt here. The islands are nominally under the government of the Moluccas, which the native chiefs acknowledge; and in most years a commissioner arives from Amboyna, who makes the tour of the islands, hears complaints, settles disputes, and carries away prisoner any heinous offender. This year he is not expected to come, as no orders late yet heen received to prepare for him; so the people of Dobbo will probably be left to their own devices. One day a man was caught in the act of stealing a piece of iron from Herr Warzbergen's house, which he had entered by making a hole through the thatch wall. In the evening the chief traders of the place, Bugis and Chinese, assembled, the offender was tried and found guilty, and sentenced to receive twenty lashes on the spot. They were given with a small rattan in the middle of the street, not very severely, as the executioner appeared to sympathise a little with the culprit. The disgrace seemed to be thought as much of as the pain; for though any amount of clever cheating is thought rather meritorious than otherwise, open robbery and housebreaking meet with universal reprobation.

## CHAPTER XXXI.

## TRE ARC ISIANDS-JOULSEY AND RESIDENCE IN THE INTERIOR.

(Manch TO May 1857.)

$\mathrm{M}^{\mathrm{I}}$Y boat was at length ready, and having obtained two men besides my own servants, after an enormous amount of talk and tromble, we left Dobbo on the morning of March 13th, for the mainland of Aru. By noon we reached the mouth of a small river or creek, which we ascended, windiug among mangrove swamps, with here and there a glimpse of dry lanl. In two hours we reached a house, or rather small shed, of the most miserable description, which our steersman, the "Orang-kaya" of Wamma, said was the place we were to stay at, and where he had assured me we could get every kind of hird and beast to be found in Aru. The shed was occupied by about a dozen men, women, and chikren; two cooking fires were burning in it, and there seemed little prospect of my obtaining any accommodation. I however deferred inquiry till I had seen the neighbouring forest, and imuediately started off with two men, net, and guns, along a path at the bnek of the house. In an hour's walk I saw enough to make me determine to give the place a trial, and on my return, finding the "Orang-kaya" was in a strong fever-fit and unable to do anything, I entered into negotiations with the owner of the house for the use of a slip at one end of it about five feet wide, for a week, and agreed to paty as rent one "parang," or chopping-knife. I then immediately got my boses and bedding out of the boat, hung up a shelf for my bird-skins and insects, and got all ready for work next morning. My owu boys slept in the boat to guard the remainder of my property; a cooking place sheltered by a few mats was arrauged under a tree cluse by, and I felt that degree of satisfaction and enjoyment which I always experience when, after much trouble
and delay, I am on the point of beginning work in a new locality.

One of my first objects was to inquire for the people who are accustomed to shoot the Paradise birds. They lived at some distance in the jungle, and a man was sent to call them. When they arrived, we had a talk by means of the "Orang-kaya" as interpreter, and they said they

thought they could get some. They explained that they shoot the birds with a bow and arrow, the arrow laving a conical wooden cap fitted to the end as large as a tercup, so as to kill the bird by the violence of the blow without making any wound or snedding any blood. The trees frequented ly the birds are very lafty; it is therefore necessary to erect a small leafy covering or hut among the branches, to which the hunter mounts before daylight in the morning and remains the whole day, and whenever a bird alights they are almost sure of securing it. (Sce Ilhustration.) They veturned to their homes the same evening, and I never saw anything more of them, owing, as I afterwards found, to its being too enrly to obtain birds in good plumage.

The first two or three days of our stay here were very wet, and I obtained but few insects or birds, but at length, when I was beginning to despair, my boy Baderoon returned one day with a specimen which repaid me for months of delay and expectation. It was a small hivd, a little less than a thrush. The greater part of its plumage was of an intense cimablor red, with a gloss as of spun glass. On the head the feathers became short and velvety, and shaded into rich orarge. Beneath, from the breast downwards, was pure white, with the softress and gloss of silk, and across the breast a band of deep metallic green separated this colour from the red of the thront. Above each eye was a round spot of the same metallic green; the bill was yellow, and the feet and legs were of a fine cobalt blue, strikingly contrasting with all the other parts of the body. Merely in arrangement of colours and texture of plumage this little bird was a gem of the tirst water, yet these comprised only half its strange beaty. Springing from each side of the breast, and ordinarily lying concealed under the wings, were little tufts of greyish feathers about two inches long, and each terminated by a brond band of intense emerald green. These plumes can be raised at the will of the bird, and spread out into a pair of elegant fans when the wings are elevated. But this is not the only ormament. The two middle feathers of the tail are in the form of slender wires about five inches long, and which diverge in a beautiful double curve. About half an inch of
the end of this wire is webled on the outer side only, and coloured of a fine metallic green, and being curled spirally inwards form a pair of elegant glittering buttons, hanging five inches below the body, and the same distance apart. These two ornaments, the breast fans and the spiral tipped tail wires, are altogether unique, not oceuring on any other slecies of the eight thousand different birds that are lnown to exist upon the earth; and, combined with the most exquisite beanty of plumage, render this one of the most perfectly lovely of the many lowely productions of nature. My transports of admatration and delight quite amused my Aru hosts, who saw nothing mote in the "Burong daju" than we do in the robin or the goldfinch. ${ }^{1}$

Thus one of my objects in coming to the far East was accomplishel. I had obtained a specimen of the King Bird of Paralise (P'tralisea regria), which had been deseribed ly Linneus from skins preserved in a mutilated state ly the natives. I knew how few Europeaus had ever luheld the perfect lithle organism I now gazed upon, and how very imperfectly it was still known in Europe. The emotions excited in the minds of a maturalist, who has long desired to see the actual thing which he has hitherto known only by description, drawing, or badly-preserved external covering-especially when that thing is of surpassing mity and beanty, repuire the poetio faculty fully to express illem. The remote ishand in which I found myself situated, in an almost unvisited sea, far from the tracks of merchant tleets and navies; the wild luxuriant tropical forest, which stretched far awny on every side; the rude moultured savages who gathered round me,-all had their influence in determining the emotions with which I gazed upon this "thing of beanty." I thought of the long ages of the past, during which the successive generations of this little creature had run their course-year by year being burn, and living and dying amid these dark and gloomy woods, with no intelligent eye to gaze upon their loveliness ; to all appearance such a wanton waste of beaty. Such ideas excite a feeling of melan-

[^8]choly. It seems sad, that on the one hand such exquisite creatures should live out their lives and exhibit their charms only in these widd inhospitable regious, doomed for ages yet to come to hopeless barbarism; while on the other hand, should civilized man ever reach these distant lands, and bring moral, intellectuat, and physical light into the recesses of these virgin forests, we may be stue that he will so disturb the nicely-balanced relations of organic and inorganic nature as to cause the disappearance, and finally the extinction, of these very leings whose wonderful structure and beaty he alone is fitted to appreciate and enjoy. This consideration must surely tell us that all living things were not made for man. Many of them have no relation to him. The eycle of their existence has gone on independently of his, and is disturbed or broken by every adrance in man's intellectual development; and their happiness and enjoyments, their lowes and hates, their struggles for existence, their vigomons life and early death, would seem to be immediately related to their own well-being and perpetuation alone, limited only by the equal well-tueing and perpetuation of the numberless other organisms with which each is more or less intimately conneeted.

After the first king-hird was obtained, I went with my men into the forest, and we were not only rewardel with another in equally perfect plumage, but I was enabled to see a little of the habits of both it and the larger spectes. It frequents the lower trees of the less dense torests, and is very active, flying strongly with a whirring sound, and continually hopping or flying from branch to branch. It eats hard stone-bearing fruits as large as a gooseberry, and often flutters its wings after the manner of the South American manakins, at which time it elevates and expands the beautiful fans with which its breast is adorned. The natives of Aru call it "Goby-goby."

One day I got under a tree where a number of the Great Paradise birds were assembled, but they were high up in the thickest of the foliage, and flying and jumping about so continually that I could get no good view of them. At length I shot one, lut it was a young specimen, and was entirely of a rich chocolate-brown colour, without either
the metallic green throat or yellow plumes of the fullgromn bird. All that I had yet seen resembled this, and the natives told me that it would be about two months before any would be found in full plumage. I still hoped, therefore, to get some. Their voice is most extraordinary. At early morn, before the sun has risen, we hear a loud ery of "Wawk-wawk-wawk, wõk-wök-wök," which resound through the forest, changing its direction continually. This is the Great Bird of Paradise going to seek his breakfast. Others soon follow his example; luries and partoquets ery shrilly, cockatoos seream, king-hunters croak and lark, and the various smaller birds chirp and whistle their morning song. As I lie listening to these interesting sounds, I realize my position as the first European who has ever lived for montls together in the Aru islames, a place which I had hoped rather than expected ever to visit. I think how many besides myself have longed to reach these almost fairy realms, and to see with their own eyes the many wonlerful and beartiful things which I am daily encountering but now Ali and Baderoon are up and getting ready their guns and ammmition, and little Baso has his fire lighted and is boiliug my coftee, and I remember that I had a black cockatoo brought in late last night, which I must skin immediately, and so I jump up and begin my day's work very happily.

This cockatoo is the first I have seen, and is a great prize. It has a rather small ame weak body, long weak legs, large wings, and an enormously developed head, ornamented with a magnificent crest, and armed with a shatp-pointed hooked bill of inmense size and strength. The plumage is entirely back, but has all over it the curious powdery white secretion characteristic of cockatoos. The cheeks are bare, and of an intense blood-red colour. Insteal of the harsh scream of the white cockatoos, its voice is a somewhat plaintive whistle, The tongue is a eurious oryan, being it slender fleshy cylinder of a deep red colour, terminated ly a horny black phate, furrowed across and somewhat prohensile. The whole tungue has a considerable extensile puwer. I will here relate sonething of the hahits of this bird, with which I have sinco
become acquainted. It frequents the lower parts of the forest, and is seen singly, or at most two or three truetlure. It flies slowly and noiselessly, and may be killed by it

IEAD OF WLACF COEKAJOX.
comparatively slight wound, It eats varions fruits and seeds, but seems more particularly atfached to the kernel of the kanary-mut, which grows on a lofty forest tree
(Canarium commune), abundant in the islands where this bird is found; and the manner in which it rets at these seets shows a correlation of structure and hathits, which would point out the "kanary" as its special food. The shell of this mat is so excessively hard that only a heavy hammer will crack it; it is somewhat triangolar, and the outside is quite smonth. The manner in which the bird opens these muts is very curious. Taking one endways in its bill and keeping it firm ly a pressure of the tongue, it cuts a transverse noteh by a lateral sawing motion of the sharpedyed lower mandible. This dome, it takes hold of the mut with its font, and liting off a piece of leaf retains it in the deep noteh of the upper mandible, and again seizing the mut, which is prevented from slipping by the elastic tissue of the leaf, fixes the elge of the lower mandible in the notch, and by a powerful nip breaks of a piece of the shell. Again taking the nut in its claws, it inserts the very long and sharp point of the bill and picks ont the kernel, which is seized hold of, morsel by morsel, by the extensible tongue. Thus every detail of form and structure in the extraominary bill of this bird seems to have its use, and we may aasily conceive that the black eockatoos have maintained themselves in competition with their more active and more numerous white allies, ly their power of existing on a kind of food which no other bind is able to extract from its stony shell. The species is the Microglossum aterrimum of naturalists.

During the two weeks which I spent in this little settlement, I had good opportunitfes of ohserving the natives at their own home, and living in their usual manner. There is a great monotony and unifurmity in every-day savage life, and it seemed to me a more miserable existence than when it had the charm of novelty. To begin with the most important fact in the existence of uncivilized peoples-their food-the Aru men have no regular supply, no stalf of life, such as bread, rice, mandiocea, maize, or sago, which are the daily food of a lare proportion of mankind. They have, however, many sorts of vegetables, plantains, yams, sweet potatoes, and raw sago; and they chew up vast quantities of sugar-cane, as well as betelnuts, gambir, and tobacco. Those who live on the coast
have plenty of fish; but when inland, as we are here, they only go to the sea occasionally, and then bring home cockles and other shell-fish by the boatload. Now and then they get wild pig or kangaroo, but too rarely to form anything like a regular part of their diet, which is essentially vegetable ; and what is of more importance, as affecting their health, gteen, watery vegetables, imperfectly cooked, and even these in varying and often insuthicient quantities. To this diet may be attributed the prevalence of skin diseases, and uleers on the legs and joints. The scurfy skin disease so common among savages has a close comexion with the poomess and irregularity of their living. The Mrlays, who are never without their daily rice, are generally free from it; the hill-Dyaks of Borueo, who grow rice and live well, are clean skimaed, while the less industrious and less clanly tribes, who live for a portion of the year on fruits and vegetables only, are very sulyject to this maliudy. It seems clear that in this, as in other respects, man is not able to make a beast of himself with impunity, feeding like the cattle on the herbs and fruits of the earth, and taking no thought of the morrow. To maintain his health and beauty he must labour to prepare some farinaceous product capable of being stored and accumulated, so as to give lim a regular supply of wholesome food. When this is obtained, ho may add vegetables, fruits, and meat with advantage.

The chief luxury of the Aru people, besides betel and tobacco, is arrack (Java rum), which the traders bring in great quantities and sell very cheap. A day's fishing or rattan cutting will purchase at least a haltgallon bottle; and when the tripang or birds' nests collected during a season are sold, they get whole boxes, each containing fifteen such bottles, which the inmates of a louse will sit round day and night till they have finished. They themselves tell me that at such bouts they often tear to pieces the house they are in, break and destroy everything thoy can lay their hands on, and make such an infernal riot as is alarming to behold.

The houses and furniture are on a par with the food. A rude shed, supported on rough and slender sticks rather than posts, no walls, hut the Hoor raised to within a foot
of the eaves, is the style of architecture they usually alopt. Inside there are partition walls of thateh, forming Jittle boxes or sleeping places, to aecommodate the two or three separate families that usually live topether. A few nats, baskets, and cooking vessels, with phates aml basing parchased from the Macassar traders, constitute their whole furniture; spears and bows are their weapons; a sarong or mat forms the elothing of the women, it waistcloth of the men. For hours or even for days they sit inle in their honses, the women bringing in the vergetables or sago which form their food. Sometimes they lunt or tish a little, or work at their honses or canoes, but they serem to enjoy pure idleness, and work as little as they can. They lave little to vary the monotony of life, little that can be called pleasure, except illeness and conversation. And they extainly do talk! Every evening there is a little Babel arome me: but as I understand not a word of it, I go on with my book or work undisturbed. Now and then they scream and shout, or laugh frantically for varicty: and this goes on alternately with vociferous talking of men, women, and children, till long after I am in my mosquito curtain and sound aslecp.

At this place I obtained some light on the complicated mixture of races in Aru, which would utterly confound an ethnologist. Many of the natives, though equally dark with the others, have little of the Papuan physiognomy, but have more delicate features of the European type, with more glossy, curling hair. These at first quite puzzled me, for they have no nore resemblance to Malay than to Paptan, and the darkness of skin and hair would forbid the jdea of Dutch intermixture. Listening to their conversation, however, I detected some words that were familiar to me. "Accabó" was one; and to be sure that it was not an accidental resemblance, I asked the speaker in Malay what "accabó" meant, and was told it meant "done or finished," a true Portuguese word, with its meaning retained. Again, I heard the word "jafui" often repeated, and could see, without inquiry, that its meaning was "he's gone," as in Portugtese. "Porco," too, seens a common name, though the people have no idea of its European meaning. This cleared up the difticulty. I at
once understood that some early Portuguese traders had penetrated to these islands, and mixed with the natives, influencing their language, and leaving in their descendants for many gemerations the visilhe characteristics of their race. If to this we add the nccasional mixture of Malay, Duteh, and Chinese with the imdigenous lapuans, we have no reason to womder at the carions ratieties of fom and feature recasionally to be met with in Aru. In this very house there was a Macassar man, with on Aru wile and a family of mixed chihdren. In Dohho I saw a Jatmese and an Ambayna man, each with an Aru wife and fanily; nod as this kind of mixture hats benn groing on for at least three handred years, and probably much longer, it has produced a deciter effect on the physical characteristios of a considerable portion of the population of the ishauts, more especially in Dhblo and the parts nearest to it.

Mraveh 28th. -The "Orang-kaya" being very ill with fever had begced to go home, and hard arranged with one of the men of the house to go on with me as his substitute. Now that I wantel to move, the bugber of the pirates was brought up, and it was pronounced unsafe to gro further than the next small river. This would not suit me, as I had determined to traverse the channel called Watelai to the "blakang-tana;" but my guide was firm in his dread of pirates, of which I knew there was now no danger, as several vessels had gone in search of them, as well as a Dutch gunboat which had arrived since I left Dobbo. I baid, fortunately, by this time heard that the Dutch "Commissie" had really arrived, and therefore threatened that if my guide did not go with me immedintely, I would appeal to the authorities, and he would certainly be obligel to give back the cloth which the "Orang-kaya" had translerred to him in prepayment. This had the desired effect ; matters were soon arranged, and we started the next morning. The wind, however, was dead against us, and after rowing hard till midday we pat in to a small river where there were a few huts, to cook our dinmers. The phace did not look very promising. but as we could not reach our destination, the Watelai rivor, owing to the contrury wind, I thought we might as well wait here a day or two. I therefore paid a chopper for the use of a small shed, and got my bed und
sume boxes on slore. In the evening, after dark, we were suddenly alarmed by the cry of "Bajak! bajak!" (Pirates!) The men all seized their bows and spears, and rushed down to the heach; we got hold of our guns and prepared for netion, but in a few minutes all came back langhing and chattering, for it had proved to be only a small boat and seme of their own comrades returned from fishing. When all was quict again, one of the men, who could speak a little Malay, came to me and begred me not to sleep too hard. "Why ?" said I. "Perhaps the pirates may renlly come," said he very seriously, which made me laugh and assure him I should sleep as hard as I could.

Two days were spent here, but the place was moproductive of insects or birds of interest, so we made another attempt to get on. As soon as we got a little away from the land we had a fair wind, and in six hours' sailing reached the entrance of the Watelai channel, which divides the most northerly from the middle portion of Aru, At its mouth this was about half a mile wide, but soon narrowed, and a mile or two on it assumed entirely the aspect of a river about the width of the Thames at London, winding among low but undulating and often hilly country. The scene was exactly such as might be expected in the interior of a continent. The channel continued of a uniform average width, with reaches and sinuous bends, one bank being often precipitous, or even forming vertical clifts, white the other was flat and apparently alluvial ; and it was only the pure salt-water, and the absence of any stream but the slight flux and reflux of the tide, that would enable a person to tell that he was navigating a struit and not a river. The wiud was fair, and carried us along, with occasional assistance from our oars, till about three in the afternoon, when we landed where a little brook formed two or three basins in the coral rock, and then fell in a miniature cascade into the salt-water river. Here we bathed and cookel our dinner, and enjoyed ourselves lazily till sunset, when we pursued our way for tro hours more, and then mored our little vessed to an overhanging tree for the night.

At five the nost morning we started again, and in an hour overook fine lowe fran containing the "Com-
missie," who had come from Dohbo to make 1.ner otlicial tone round the ishands, and herd passed us in thes night. I paid a visit to the Jutehnon, one ot whoms spoke a little English, Lut we found that we conld get on much better with Malay. They tohd me that they had been delayed soing after the pirates to one of the northem islands, and had seen three of their vessels lout conld not catch them, because on being pursued they rowed out in the wind's eye, which they are emabled to do by laving about fifty oars to each boat. Having had some toa with them, I bade them adieu, and turned up a netrow chanmel which our pilot said wrould take us to the village of Watelai, on the east side of Aru. Alter gumir some miles we found the chanmel nealy blocked up with ental, so that our boat grated along the botom, crunching what may truly be called the living rock. Sometimes all homds bat to get out and wade, to lighten the vessel anul lift it over the slatlowest places; but at lengtl we overeane all obstacles aud reached a wide bay or estarary studded with little rocks and islets, and opening to the eastern sea and the mumerous islands of the "blakang-tan." I now foumd thas the village we were going to was miles away; that we should have to go out to sea, and round a rocky point. $A$ sequall seemed coming on, and as I have a lorror of small buats at sea, and from all I could learn Watelai vilhuge was not a place to stop at (no Birds of Paralise being found there), I determined to return and go to a village I had heard of up a tributary of the Watelai river, amb situated nearly in the centre of the mainlanl of Ara. 'Ihes people there were said to be good, and to be accustomed th hunting and bird-catchiug, being too far indand to get any part of their fool from the sea. Whild I was deciding this point the squall burst upon us, find soon raised is rolling sea in the shallow water, which upset an oil buttle and a lamp, broke some of my crockery, and threw us all into confusion. lowing hard we managed to get back into the main river by dusk, and lowked out for a place to cook our suppers. It happened to he high water, and a very high tide, so that every piece of sand or hatala was covered, and it was with the wreatest ditliculty, and afier mouch groping in the dark, that we discovered a lithe
sloping piece of rock about two feet square on which to make a fire and cook some rice. The next day we continued our way back, and on the following day entered a stream on the south side of the Watelai river, and ascending to where naviration ceased found the little village of Wanumbai, consisting of two large houses surrounded by plantations, amid the virgin forests of $A$ ru.

As I liked the look of the place, and was desirous of staying some time, I sent my pilot to try and make a bargain for house accommodation. The owner and chief man of the place made many excuses. First, he was afraid I would not like his house, and then was doubtful whether lis son, who was away, would like his admitting me. I hal a long talk with him myself, and tried to explain what I was doing, and how many things I would buy of them, and showed him my stock of bends, and knives, and cloth, and tobacco, all of which I would spend with his family and friends if he woukd give me houseroom. He seemed a little stagrered at this, and said he would talk to his wife, and in the meantime I went for a little walk to see the neighbourhood. When I came back, I again sent my pilot, saying that I would go away if he would not give me part of his house. In about half an hour he returned with a demand for about half the cost of buiding a house, for the rent of a small portion of it for a few weeks. As the only ditliculty now was a pecunary one, I grot ont about ten yards of cloth, an axe, with a few beats and some tobaceo, and sent them as my final offer for the part of the house which I had before pointed out. This was accepted after a little more talk, and I imnediately proceeded to take possession.

The house was a good large one, raised as usual about seven feet on posts, the walls about three or four fect more, with a high-pitched roof. The floor was of bamboo laths, and in the sloping roof was an immense shutter, which could be lifted and propped up to admit light and air. At the end where this was situated the floor was raised abont a foot, and this piece, about ten feet wide by twenty long, quite open to the rest of the louse, was the portion I was to occupy. At one end of this piece, separated by a thatch partition, was a cooking place, with
a clay floor and shelves for crockery. At the opposite end I had my mosquito curtain hung, and round the walls wo arrauged nyy boxes and other stores, fitted up a tatole and seat, and with a little cleaning and dustimer made the place look quite comfortable. My bont was then hauled up on shore, and covered with palm-leaves, the sails and oars brought indoors, a hanging-stage for drying my specimens erected outside the house and another inside, and my boys were set to clean their guns and get all ready for beginning work.

The next day I oceupied myself in exploring the paths in the immediate neighbourhood. The small river up which we had asconded ceases to le navigable at this point, above which it is a little rocky brook, which quite dries up in the hot season. There was now, however, a fair stream of water in it; and a path which was partly in and partly by the side of the water, promised well for insects, as I here saw the marnificent blue butterfly, Papilio ulysses, as well as several other fine species, flopping lazily along, sometimes resting hygh up on the foliuge which drooped over the water, at others settling down on the damp rock or on the edges of muddy ponls. A little way on several paths branched off through patches of second-growth forest to cane-fields, gardens, and seattered houses, beyond which again the dark wall of verdure striped with tree-trunks, marked out the linits of the primeval forests. The voices of many birds promised good shooting, and on my return I found that my boys had already obtained two or three kinds I had not seen before; and in the evening a native brought me a rave and beautiful species of ground-thrush (Pitta nove-guinese) hitherto only known from New Guinea.

As I improved my acquaintance with them I becamo much interested in these people, who are a fair sample of the true savage inbabitants of the Aru Islands, tolerably free from foreign admixture. The house I lived in contained four or five families, and there were generally from six to a dozen visitors besides. They kept up a continual row from morning till night-talking, laughing, shouting, without intermission-not very pleasant, but interesting as a study of mational character. My boy Ali said to me,
"Banyak quot bitchara Orang Arn" (The Aru people are very strong talkers), never having been accustomed to such eloquence eithor in his own or any other country he had hitherto visited. Of an evening the men, having got over their first shyness, began to talk to me a little, asking about my country, \&c., and in return I questioned them about any traditions they had of their own origin. I had, however, very little success, for I could not possibly make them understand the simple question of where the Aru people first came from. I put it in every possible way to them, but it was a subject quite beyond their speculations; they had evidently never thought of anything of the kind, and were uaable to conceive a thing so remote and so unnecessary to be thonght about, as their own origin. Finding this hopeless, I asked if they knew when the trade with Aru first began, when the Bugis and Chinese and Macnssar men first came in their pans to buy tripang and tortoise-shell, and birds' nests, and Paradise birds? This they comprehended, but replied that there had alwas been the same trade as long as they or their fathers recellected, but that this was the first thme a real white man had come among them, and, said they, "You see how the people come every day from all the villages round to lonk at you." This was very flattering, and aceounted for the great concourse of visitors which I had at first imagined was accidental. A few years before I had been one of the gazers at the Zoolus and the Aztecs in London. Now the tables were turned upon me, for I was to these people a new and strauge variety of man, and had the honour of atfording to them, in my own person, an attractive exlifbition, gratis.

All the men and boys of Aru are expert archers, never stirring without their bows and arrows. They shoot all sorts of birds, as well as pirs and kangaroos occasionally, and thus have a tolerably good supply of meat to eat with their verctables. The result of this better living is superior healthiness, well-made bodies, and generally clear skins. They brought me numbers of small hinds in exchange for beads or tobacco, but mauled them terribly, notwithstauding my repeated instructions. When they got a bird alive they would often tie a string to its leg, and keep it a day
or two, till its plemane wats so drarglel and dirtien us wh be almost worthless. One of the tirst things I got from them was a living specinen of the carivas and beatiful racquet-tailed kinghisher. Seeing how much I admired it, they afterwards brought me several more, which were all caught before daybreak, sleeping in eavities of the rocky bauks of the stream. My hunters also shot a few specimens, and alnost all of them had the red bill more or less elogred with mud and carth. This inlicates the hathits of the bind, which, though popularly a king-lisher, never catches fish, but lives on insects and minute shells, which it picks up in the forest, daxting down upon them from its perch on some low branch. The genas Tanysiptera, to which this biril helougs, is remakable for the enomomsly lengthened tail, which in all oher kiugfishers is small ant short. Linneus named the species known to him "the godless kingfisher" (Alcelo dea), from its extreme grace and beaty, the plunage being brilliant blue and white, with the bill red, like coral several species of these interesting lirds are now known, all confined within the very limited area which emmprises the Moluceas, New Guinea, and the extreme Nortls of Australia. They resemble each other so closely that several of them can only bee distinguished ly careful comparison. Oue of the rarest, however, which inhahits New Guinea, is very distinct from the rest, being hight rel leneath instead of white. That which 1 now oltained was a new one, and has been named Tanysiptera hydrocharis, but in general form and coloration it is exactly similar to the larger species found in Amboyna, and figured at page 298.

New and interesting linds were cantinually lrought in, either loy my own boys or ly the natives, and at the end of a week Ali arrivel triumphant one afternoon with a fine specimen of the Great Bird of Paradise. The ornamental flumes had nut yet attained their full growth, but the richness of their glossy mance colouring, and the exquisite delicacy of the loosely wavime feathers, were unsurpassable. At the same time a great back conkatoo was brought in, als well as a fine fruit-pigenn and sereral small birds, so that we wore all kept hare at work skinuing till sunset. Just as we had cleared away and packed up for the might, a
strauge beast was bramght, which had been shot by the natives. It resembled in size, and in its white woolly covering, a small fat lamb, but had short legs, hanl-like feet with large claws, and a long prehensile tail. It was a Cuscus (C. maculatus), one of the cupions marsupial animals of the l'apuan reginn, and I was very desirous to obtain the skin. The owners, however, said they wanted to eat it; and though I offered them a good price, and promised to give them all the meat, there was great hesitation. Suspecting the reason, I offered, though it was night, to set to work immediately and get out the looly for them, to which they agreed. The creature was much hacked about, and the two hind feet almost cut off, but it was the largest and finest specimen of the kind I had seen; and after an hour's hard work I handed over the body to the owners, who inmediately cut it up and roasted it for supper.

As this was a very good place for hirds, I determined to remain a month longer, and took the opportunity of a native boat going to Doblo, to send Ali for a fresh supply of ammunition and provisions. They started on the 10 th of April, and the house was crowded with about a hundred men, boys, women, and girls, bringing their loads of sugarcane, plantains, sirili-leaf, yams, \&c.; one lad going from each house to sell the produce and make purchases. The noise was indescribable. At least fifty of the hundred were always talking at once, and that not in the low measurel tones of the apathetically polite Malay, but with loud voices, shouts, and screawing laughter, in which the women and children were even more conspicuous than the men. It was only while gazing at me that their tongues were moderately quiet, because their eyes were fully oceupied. The back vegetable soil here overlying the coral rock is very rich, and the sugu-cane was finer than any I had ever seen. The canes brought to the boat were often ten and even twelve feet long, and thick in proportion, with short joints throughout, swelling between the knots with the abundance of the rich juice. At Dobho they get a high price for it, $1 d$, to $3 d$. a stick, and there is an insatiable demand among the crews of the praus and the Baba fishermen. Here they eat it continually They half live on it,
and sometimes feed their pigs with it. Near erory lomse ate great heaps of the refuse cane; and lare wicker-latskets tu contain this refuse as it is 1 proheed form a regular barb of the furniture of a house. Whatever time of the day you enter, you are sure to find three or four people with a yard of eane in one hand, a knife in the other, and a braket between their legs, hacking, paring, chewing, and basketfilling, with a persevering assiduity which reminds one of a hungry cow grazing, or of a caterpillar eatiog up a leaf.

After five days' abseuce the boats returned from Dobbe, bringing Ali and all the things I had sent for quite safe. A large party had assembled to be ready to canry home the goods brought, among which were a gool many cocon-nuts. which are a great luxury bere. It seems strange that they should never plant them; but the reason simply is, that they cannot lring their hearts to bury a grood nut for the prospective advantage of a crop twelve years hence. There is also the chance of the fruits being dug up and caten unless watched night and day. Among the things I had sent for was a lox of arrack, and I was now of course besieged with requests for a little drop. I gave them a flask (about two bottles), which was very soon finished, and I was assured that there were many present who had not had a taste. As I feared my box would very som be emptied if I supplied all their demands, I told them I had given them one, but the second they must pay for, and that afterwards I must have a Paradise bird for each Hask. They immediately sent round to all the neighbouring houses, and mustered up a rupee in Dutch copper money, got their secoud llask, mol drank it as quickly as the first, and were then very talkative, but less noisy and importumate than I had expected. Two or three of them got round me and begged me for the twentieth time to tell them the name of my country. Then, as they conld not pronounce it satisfactorily, they insisted that I was deceiving them, and that it was a name of my own invention. One funmy old man, who bore a ludicrous resemblance to a friend of mine at hone, was almost indiguant. "Unglung!" said le, " who ever heard of such a name ?-ang-lang-anger-lang-that can't be the name of your country ; you are playing with us." Then he tried to give a cou-
rincing illustration. "My country is Wanumbai-anybody can say Waumbai. I'm an 'orang-Wadumbai;' but, N-glung! who ever heard of such a name? Do tell us the real name of your country, aud then when you are mone we shall know how to talk about you." To this luminous argument and remonstrance I couhl oppose nothing but assertion, and the whole party remained firmly convinced that I was for some reason or other deceiving them. They then attacked me on another point -what all the animals and birds and insects and shells were preserved so carefully for. They had often asked me this before, and I had tried to explain to them that they would he stuffed, and mado to look as if alive, and people in my country woull go to look at them. But this was not satisfying; in my country there must be many better things to look at, and they could not believe I would take so much tromble with their birds and beasts just for people to look at. They did not want to look at them ; and we, who made calico and glass and knives, and all sorts of wonderful things, could not want things from Aru to look at. They had eridently been thinking ahout it, and had at length grot what seemed a very satisfactory theory; for the same old man said to me, in a low mysterious voice, "What becomes of them when you go on to the sea?" "Why, they are all packed up in boxes," said I. "What did you think heenne of them?" "They all come to life again, don't they?" said le, and though I tried to joke it off, and sail if they dill we should have plenty to eat at sea, he stuck to his opinion, and kept repeating, with an air of deep conviction, "Yes, they all come to life again, that's what they do-they all come to life again."

After a little while, and a good deal of talking among themselves, he began again-"I know all about it-oh. yes! Before you came we had rain every day-very wet indeed; now, ever since you have been here, it is fine hot weather. Oh, yes ! I know all about it ; you can't deceive me." And so I was set down as a conjurer, and was unable to repel the charre. But the conjurer was completely puzzled by the next question: "What," said the ohl man," is the great ship, where the Dugis and

Chinanen go to sell their things? It is always in the great sea-its mane is Jong; tell $u s$ all about it." In vain I inquired what they knew about it; they knew nothing but that it was called "Jong," and was always in the sea, and was a very great ship, and concluded with, "Perhaps that is your country?" Fimdins that I could not or would not tell them anything about "Jong," there came more regrets that I would not tell them the real name of ny country; aud then a long string of compliments, to the effect that I was a much better sort of a persm than the Bugis and Chinese, who sonetimes came to trade with them, for I gave them things for nothing, and din not try to cheat them. How long would I stop? was the next earnest inquiry. Would I stay two or three months? They would get me plenty of birds and animals, and I might soon finish all the gonds I had brought, and then, said the old spokesman, "Don't go away, but send for more things from Dobbo, and stay here a year or two." Ant then again the old story, "Do tell us the name of your comentry. We know the Bugis men, and the Macassar men, and the Java men, ant the China men; only you, we don't know from what country you cone. Ung-hung! it can't be ; I know that is not the name of your country." Seeing no end to this long talk, I said 1 was tired, and wanted to ro to sleep; so atter berging-one a litte bit of dry fish for his supper, nud another at little salt to eat with his sago-they went off very quictly, and I went outside and took a stroll round the house by monlight, thinking of the simple people and the strange productions of Aru, atod then tumod in under my mosyuito curtain, to sleple with at semse of perfect security in the midst of these grodnatured savages.

We now had seven or eight days of hot and dry weather, which matued the litterver to a sinecossime of shathow mons commecterl by the smallest prasibhe the ad at triokling water. If theme were a dry seazon like that of Macassar, the dru Islands would bo minhatitable ats thome is no prate of them math above a humberl fom hish : mat the whole foing at mass of prous comalline rock, allows the surface water rapidly tio exerpe. The onty dive season they have is lur a month or tro about kegtomber or

Octoher, and there is then an excessive scarcity of water, so that sometimes hundreds of binds aml other animals die of dronght. The matives then rimove to lumses near the sourers of the small streams, where, in the shady depths of the forest, a small iflatatity of water still remains. Even then many of them have to go miles for their water, which they leep in laty bumhous and use very sparimely. They assure we that they catels and kill game of all kinds, by wathding at the water holes or soting shares around them. That would be the time for me to make my collections; lut the want of water wonld the a terrible annoyance, and the impossibility of getting away before another whole year had phissed mate it out of the question.

Ever since leaviug Dohbo I had sulfered terribly from insects, who sewned here bent upon revengiag my longcontinued persecution of tleir race. At our first stoppingplace sand-flies were very abundant at night, penetrating to every part of the body, ant producing a more lasting irritation than mosuntoes, My feet and ankles enpecially sulfered, and were completely covared with little red swollen speeks, which tornented ine horribly. On ariving here we were delighted to find the house free from sandties or mosquitoes, but in the plantations where my daily walks led me, the day-liting mosquitoes swarmed, and seemed especially to delight in attacking my poor feet. Alter a month's incessant punishment, those usefnu nembers rebelled against such treatment and broke into open insurrection, throwing out numerous inflaned ulcers, which were very paniul, and stopped me from walking. So I found myself confined to the house, and with no immeliate prospect of leaving it. Wounds or sores in the feet are especially difficult to heal in hot climates, and I therefore dreaded them more than any other illness. The confinement was very annoying, as the fine hot weather was excellent for insects, of which I had every promise of obtaining a fine collection; and it is only by daily and unremitting search that the smaller kinds, and the rarer nud more interesting specimeos, can be obtained. When I crawled down to the river-side to bathe, I often saw the blue-winged Popilin ulysses, or some other equally rare and beautiful insect ; lut there was nothing for it but patience,
and to return quietly to my bird-skinning, or whatever other work I had imbors. The stings and bites aud censeless irritation caused by these pests of the tropical forests, would be borne uncomplainingly; but to be kept prisoner by them in so rich and unexplored a country, where rare and beantiful creatures are to he met with in every forest ramble-a country reacher by such a long and tedious voyage, and which might not in the present century be again visited for the same purpose-is a punishment too severe for a naturalist to passo over in silence.

I had, however, some consolation in the hirds my boys brourgt home daily, more especially the Iramiseas, which they at length obdined in full plumage. It was quite a relief to my mind to get these, for I could havelly have torn myself away from tru had I not oltained specimens. But what I valued almost as much as the Dirds themselves was the knowledee of their habits, which I was diily obbaining both from the accounts of my hunters, and from the conversation of the natires. 'The birds had now commenced what the people here call their "saicaleli," or dancing-parties, in certain trees in the forest, which are not fruit trees as I at first imagined, but which have an intmense head of spreading brauches and large but scattered leaves, giving a clear space for the birds to play aul exhibit their plumes. On one of these trees a dozen or twenty full-plunaged male birds assemble together, raise up their wings, stretch out their necks, and clevate their exquisite plumes, keeping them in a continual vibration. Between whiles they fly across from brauch to branch in great excitement, so that the whole tree is filled with waving plumes in every variety of attitude and motion. (See llustration facing p. 443.) The bird itself is nearly as large as a crow, and is of a rich coffee brown colour. The head and neek is of a pure straw yellow above, and rich metallic green beneath. The long plumy tufts of golden orange feathers spring from the sides beneath each wing, and when the bird is in repose are partly concealed ly them. At the time of its excitement, however, the wings are raised vertically over the back, the head is bent down and stretched out, and the lony plumes are raised up and expandel till they form two marniticent golden lans striped with deep red at the pase, and fuling
off into the pale brown tint of the finely divided and softly waving points. The whole bird is then overshadowed by them, the crouching body, yellow haad, and emerald green throat forming but the foundation and setting to the golden glory which waves ahove. When seen in this attitude, the Dird of Paradise really deserves its name, and must be ranked as one of the most beautiful and most wouderful of living things. I continued also to get specimens of the lovely little king-bird occasionally, as well as numbers of brilliant pigeons, sweet little parroquets, and many curious small birds, most nearly resembling those of Australia and New Guinea.

Here, as among most savage people I have dwelt among, I was delighted with the beanty of the hurnan form-a beauty of which stay-at-home cirilized people can searecly have any conception. What are the finest Grecian statues to the living, moving, breathing men I saw daily aroumd me ? The unrestrained grace of the naked savage as he goes about his daily oceupations, or lounges at his ease, must be seen to be understood; and a youth bending lis bow is the perfection of manly beauty. The women, however, except in extreme youth, are by no means so pleasant to Jook at as the men. Their strongly-marked features are very unfeminine, and hard work, priwations, and very early marriages soon destroy whatever of beanty or grace they may for a short time possess. Their toilet is very simple, but also, I am somy to say, very coarse, and disgusting. It consists solely of a mat of plaited strips of palm leaves, worn tight round the body, and reaching from the hips to the knees. It scems not to he changed till worn out, is selemn washed, and is gemerally very dirty. This is the miversal dress, except in a lew cases where Malay "sarongs" have come into use. Their frizzly hair is tied in a bunch at the baek of the had. They delight in combing, or rather forking it, using for that
 which answers the purpose of separating and armagiog the long tamged, fizaly mass of cramial segetation much

in various tasteful ways. The ends of a neeklace are often natached to the earrings, and then looped on to the bairknot behind. This has really an elerant appearance, the beads hanging gracefully on each side of the head, and by establishing a connexion with the earrings give an appeatance of utility to those barbarous omaments. We recommend this style to the consideration of those of the fair spx who still bore holes in their ears and hang rings thereto. Another style of nerkluce among these Papuan belles is to wear two, each langing on one side of the neck and unter the opposite arm, so as to cross each other. This has a very pretty appearance, in part clue to the contrast of the white beats or kangaroo teeth of which they are composed with the dark glossy skin. The earrings thenselves are formed of a bar of copuer or silver, twisted so that the ends cross. The men, as usual among savages, adorn themselves more than the women. They wear necklaces, earrings, and finger rings, and delight in a band of plaited grass tight round the arm just below the shoulder, to which they attach a bunch of laair or bright coloured feathers by way of ornament. The teeth of small animals, either alone, or atternately with black or white beads, form their neeklaces, and sometimes bracelets also. For these latter, however, they prefer brass wire, or the black, horny, wing-spines of the cassowary, which they consider a charm. Anklets of brass or shell, and tight ylaited garters below the knee, complete their ordinary decorations.

Some natives of Kobror from further south, and who are reckoned the worst and least civilized of the Aru tribes, came one day to visit us. They have a rather more than usually savage appearance, owing to the greater amount of ornaments they use-the most conspicuous being a large horseshoe-shaped comb which they wear over the foreliead, the ends resting on the temples. The back of the comb is fastened into a piece of wood, which is plated with tin in front, and above is attached a plume of feathers from a cock's tail. In other respects they scarcely differed from the people I was living with. They brought me a couple of lirds, some shells and insects, showing that the report of the white man and his doings
had reached their comutry. There was probably hardly a man in Aru who had not ly this time head of me.

Besides the domestic utensils alrealy mentioned, the moveable property of a native is very seanty. He has a good supply of speats and bows and arows for hunting, a parang, or chopping-knife, and an axe-for the stone age has passed away here, owing to the commercial enterprise of the Bugis and other Malay races. Attached to a belt, or hung across his shoulder, he carries a little skin pouch and an ornamented bamboo, containing betel-nut, tobacco, and lime, and a small German wooderhandled knife is generally stuck between his waist-cloth of bark and his hare skin. Each man also possesses a "cadjan," or sleeping-mat, mule of the broad leaves of a pandarus neatly sewn together in three layers. This mat is about four feet square, nad when folded has one end sewn up, so that it forms a kind of sack open at one side. In the closed corner the head or feet can be placed, or by carrying it on the head in a shower it forms both coat and umbrella. It doubles up in a small compass for convenient carriage, aul then forms a light and elastic cushion, so that on a journey it becomes clothing, house, bedding, and furniture, all in one.

The only ornaments in an Arn house are trophies of the chase-jaws of wild pigs, the heads and backbones of cassowaries, and plumes made from the feathers of the Bird of Paradise, cassowary, and domestic fowl. The spears, shields, knife-handles, and other utensils are more or less carved in fanciful designs, and the mats and leaf boxes are painted or plaited in neat patterns of red, Wack, and yellow colours. I must not forget these boxes, which are most ingeniously made of the pith of a palm leaf pegged together, lined inside with pandanus leaves, and outside with the same, or with plated grass. All the joints and angles are covered with strips of split rattan sewn neatly on. The lid is covered with the brown leathery spathe of the Areca palm, which is impervious to water, and the whole hox is neat, strong, and well finished. They are mude from a few inches to two or three feet long, and being much estemed by the Malsys as elothes-hoses, are a regular article of export from Aru.

The natives use the smaller ones for tobacco or betel-nut, but seldom have clothes enough to require the larger ones, which are only made for sale.

Among the domestic animals which may generally be seen in native houses, are gaudy parrots, green, red, and hlue, a few domestic fowls, which have baskets hung for them to lay in under the eaves, and who sleep on the ridge, and several half-starved wolfish-looking dogs. Instead of rats and mice there are curious little marsupial animals about the same size, which run about at night and nibble anything eatable that may be left uncovered. Four or five difforent kinds of ants attack everything not isolated by water, and one kind even swims across that; great spiders lurk in baskets and hoxes, or hide in the folds of my mosquito curtain; centipedes and millepedes are found everywhere. I have caught them under my pillow and on my head; while in every box, and under every board which has lain for some days undisturbed, little scorpions are sure to be found snngly ensconced, with their formidable tails quickly turned up ready for attack or defence. Such companions seem very alarming and dangerous, but all combined are not so bad as the irritation of mosquitoes, or of the insect pests often found at home. These latter are a constant and unceasing source of torment and disgust, whereas you may live a long time among scorpions, spiders, and centipedes, ugly and venomous thongh they are, and get no harm from them. After living twelve years in the tropics, I have never yet been bitten or stung by either.

The lean and hungry dogs before mentioned were my greatest enemies, and kept me coustantly on the watch. If my boys left the bird they were skinning for an instant, it was sure to be carried off. Everything eatable had to be hung up to the roof, to be ont of their reach. Ali had just finished skimning a tine King liid of Paralise one day, when he dropped the skin. Before he could stoop to pick it up, one of this famished race had seized upon it, and he only succeeded in rescuing it from its fangs after it was torn to tatters. Two skins of the large Taradisea, which were quite dry and realy to gack away, were incautionsly left on my table for the night, wrapped
up in paper. The next uroming they were gone, and only a few seatered feathers indicated thein fate. My langing shelf was out of their mach; but having stupidly left a hox which served as a step, a full-phmaged Hamdise bird was next morning missing ; and a dog below the honse was to be seen still mumbling over the fragments, with the fine golden plumes all trampled in the mud. Every night, as soun as I was in bet, I conld hear them searching about for what they eould devour, under my tithe, and all about my boxes and haskets, keeping me in a state of suspense till morning, lest something of value might incautiously have been left within their reach. They would driak the oil of my foating lamp and eat the wick, and upset or break my crockery if my lazy boys had neglected to wash away even the smell of anything eatable. lhad, however, as they are here, they were worse in a Jyak's house in Iorneo where I was once staying, for there they gnawed of the tops of my waterpoof hoots, ate a large piece ont of an ohl leather gane-hag, besides devouring a portion of my mosquito curtain!

April 28th.-Last evening we ind a grand consultation, which had evidently been arratged and diseussed beforeland. A number of the natives gathered round me, and said they wanted to talk. Two of the best Malay scholars helped each other, the rest puthing in hints and ideas in their own lauguage. They told me a long rambling story; but, partly owing to their imperfect knowletge of Malay, partly through my ignorance of local terms, and partly throngh the incoherenee of their narrative, I conld not make it out very clearly. It was, however, a tradition, and I was glad to find they had anything of the kind. A long time ago, they said, some strangers came to Art, and came here to Wammonai, and the chict of the Wanmmbai people did not like them, and wanted them to go away, but they would not go, and so it came to fighting, and many Aru men were killed, and some, along with the chief, were taken prisoners, and carried away by the strangers. Some of the speakers, however, said that he was not carried away, but went away in his own boat to eseape from the foreigners, and went to the sea and never came back again. But they all believe that the chief and the people that
went with him still live in some foreign country ; and if they could but find out where, thay would send for them to come back acgain. Now having some vague idea that white men must know every country beyond the sea, they wanted to know if I had met their people in my country or in the sea. They thought they must be there, for they could not imagine where else they could be. They had sought for them everywhere, they said-on the land and in the sea, in the forest and on the mountains, in the air aml in the sky, and could not find them; therefore, they must be in my comntry, and they begged me to tell them, for I must surely know, as I cume from across the great sea. I tried to explain to them that their friends could not have reached my country in small boats; and that there were plenty of islands like Aru all about the sea, which they would be sure to find. Besiles, its it was so long ago, the clief and all the people must be dead. But they quite laughed at this iden, and said they were sure they were alive, for they had proof af it, And then they tok me that a good many years ago, when the speakers were boys, some Wokan men who were out fishing met these lost people in the sea, and spoke to them; and the chief gave the Wokan men a hundred fathoms of cluth to bring to the men of Wanumbai, to show that they were alive and would soon come back to them; but the Wokan men were thieves, and kept the cloth, and they only heard of it afterwards; and when they spoke about it, the Wokan men denied it, and pretended they had not received the cloth; -80 they were quite sure their friends were at that time alive and somewhere in the sea. And again, not many years ardo, a report came to them that some Bugis traders had brought some children of their lost people; so they went to Dobbo to see about it, and the owner of the house, who was now speaking to me, was one who went; but the Bugis man would not let them see the children, and threatened to kill them if they came into his house. He kept the children shat up in a large box, and when he went away he took them with him. And at the end of each of these stories, they begred me in an imploring tone to tell them if I knew where their chief and their people now were.

By dint of questioning, I got some account of the
strangers who had taken away their people. They sat they were wonderfully strong, and each one could kill a great many Aru men; and when they were wonnded, however badly, they spit upon the phace, and it immediately became well. And they made a great net of rattans, and entangled their prisoners in it, and sunk them in the water; and the next day, when they pulled the net up on shore, they utale the drowned men come to lile again, and curied them away.

Much move of the same kind was told me, lout in so contised and rambling a manmer that I contil make nothing out of it, till I inquired how loug ago it was that all this happened, when they told me that after their people were taken away the lhagis came in their prans to trade in Aru, and to hoy tripang and birds' nests. It is not impossible that something similar to what they related to me really happened when the early Portuguese discoverers first came to Aru, and has formed the foundation for a eontinually increasing accumulation of legend and fable. I have no doubt that to the next reneration, or even before, I myself shall be transformed into a magician or a demigod, a worker of mirucles, and a being of supernatural knowledge. They alreaty believe that all the animals I preserve will come to life again; and to their children it will be related that they actually did so. An unusual spell of fine weather setting in just at my arrival has made them believe I can control the seasons; and the simple cireumstance of my always walking alone in the forest is a wonder and a mystery to them, as well as my asking them about hirds and animals I have not yet, seen, and showing an acquaintance with their forms, coluurs, and habits. These facts are brought against me when I disclaim knowledge of what they wish me to tell then. "You must know," say they; "you know everything : you make the fine weather for your men to shoot; mad you know all about our birds and our anmals as well as we do; and you go alone into the forest and are not afraid." Therffore every confession of ighorance on my part is thought to be a blind, a mere excuse to avoid telling them too much. My very writing materials and books are to them weird things and were I to choose to mystify
them by a few simple experiments with lens and magnet, miracles without end would in a few years cluster about me; and fiture travellers, penetrating to Wanumbai, woukd hardly believe that a pour English natumalist, who had resided a few months among them, could have been the original of the supernatural befing to whom so many marvels were attributed.

For some days I had noticel a good deal of excitement, and many strangers came and went armed with spears and cutlasses, bows and shiekls. I now found there was war near us-two neighbouring villages having a quarrel about some matter of local politios that I could not understand. They tohl me it was quite a common thing, and that they are rarely without fighting somewhere near. Individual quarrels are taken up by villages and tribes, and the nonpayment of the stipulated price for a wife is one of the most frequent causes of bitterness and bloodshed. One of the war shields was brought me to look at. It was made of rattans and covered with cotton twist, so as to be both light, strong, and very tough. I should think it would resist any ordinary bullet. About the middle there was an arm-luble with a shuter or thap over it. This enahles the arm to be put through and the bow drawn, while the body and face, up to the eyes, remain protected, which cannot be done if the shichl is carried on the amm by loops attached at the hack in the ordinary way. A few of the young men from our house went to help their friends, but I could not hear that any of them were hust, or that there was much hard fighting.

May Sth.-I had now been six weeks at Wanmmal, but for more than half the time was laid up in the honse with uleerated feet. My stores being nearly exhausted, and my bird and insect boxes full, and having no immediate prospect of getting the use of my legs again, I determinet on returning to Dobbo. Birds had lately become rather scarce, and the Paradise birds had not yet become as plentiful as the natives assured me they would be in another montli. The Wanumbai people seened very sony at my departure; and well they might he, fur the shells and insects they picked up on the way to and from their plantations, and the linds the litue boys shot
with their bows and arrows, kept them all well supplied with tolaceo and rambir, besides eunbling them to acenmulate a stock of beads and coppers for fature expenses. The owner of the house was supplied gratis with a little rice, fish, or salt, whenever he asked for it, which I must say was not very often. On parting, I distributed among then my remmant stoek of salt and tobnceo, amb gave my host a tlask of amack, and believe that on the whole my stay with these simple and cood-natured people was productive of pleasure and protit to both parties. I fully iutended to come back; and had I known that circumstances would have prevented my doing so, should have felt some sorrow in leaving a place where I had first seen so many rare and beautitul living things, and had so fully enjoyed the pleasure which fills the heart of the naturalist when he is so fortunate as to discover a district hitherto unexplored, and where every day brings forth new and unexpected treasures. We loaded our boat in the afternoon, and, starting before daybreak, by the help of a fair wind reached Dobbo late the same evening.

## CHAPTER XXXII.

## THE ARU ISLANDS.-SECOND RESDDENCE AT DORBO.

> (MAT AND JUKE 1857.)

DOLBO was full to overflowing, and I was obliged to occupy the court-house where the Commissioners hold their sittings. They had now left the island, and I found the situation agreeable, as it was at the end of the village, with a view down the principal street. It was a mere shed, but half of it bad a roughly boarded floor, and by putting up a partition and opening a window I made it a very pleasant abode, In one of the boxes I had left in charge of Hert Warzbergen, a colony of small ants had settled and deposited millions of eggs. It was luckily a fine hot day, and by earying the box some distance from

the house, and placing every article in the sunshine for an hour or two, I got rid of them withcut damaye, as they were fortunately a larmess species.

Dobbo now presented an animated appearance. Five or six new houses had been added to the street; the praus were all brought rounl to the western side of the point, where they were hauled up on the beach, and were being eaulked and coverel with a thick white lime-plaster for the homeward voyage, making them the brightest amd cleanest looking things in the place. Most of the small boats had returned fiom the "blakang-tana" (buck country), as the side of the islands towards New Guinea is called. liles of tirewood were being heaped up behind the houses; sail-makers and carpenters were busy at work mother-ol-pearl shell was being tied up in bundes, and the black and ugly suoked tripang was having a last exposure to the sun betore loading. The spare portion of the crews were employed catting and squariug timber, and boats from Cemam and Goram were constantly unloading their cargoes of sago-eake for the haders' homewand voyage. The fowls, ducks, and goats all looked fat and thriving on the refuse food of a dense population, and the Chiuamen's pigs were in a state of obesity that toreboded early death. Parrots and lories and cockatuos, of a dozen diflerent kinds, were suspended on baniore perches at the doors of the houses, with metallic green or white fruit-pigeons which cooed musically at now and eventide. Young cassowaries, strangely striped with Wack and brown, wandered about the houses or gambolled with the playtulness of kitters in the hot sunshine, with sometimes a pretty little kaugaroo, caught in the Aru forests, but already tame and graceful as a petted fawn.

Of an evening there were more signs of life than at the time of my forner residence. Tom-toms, jews'-harps, and even fiddles were to be heard, and the melancholy Malay songs suunded not unpleasantly far into the night. Almost every day there was a cock-fight in the street. The spectators make a ring, and after the longs steel spurs are tied on, and the poor animals are set down to gash and kill each other, the excitement is immense. Those who have made bets screan and yell and jump frantically, if
they think they are going to win or lose, but in a very fow minutes it is all over; there is a hurah from the wimers, the owners seize their cocks, the wimning bird is caressed and admired, the loser is qenemaly deal or very badly wounded, and his master may often be seen plucking out his feathers as he walks away, preparing him for the cooking pot while the poor bird is still alive.

A game at foot-ball, which generally took place at sumsot, was, however, much more interesting to me. The ball used is a rather small one, and is made of rattan, hollow, light, and clastic. The player keeps it dancing a little while on his foot, then oceasionally on lis arm or thigh, till suddenly he gives it a good blow with the hollow of the foot, and sends it flying high in the air. Another player runs to meet it, and at its first bound eatches it on his foot and plays in his turn. The ball must never be touched with the hand; but the arm, shoulder, knee, or thigh are used at pleasure to rest the foot. Two or three played very skilfully, keeping the ball continually flying about, but the place was too confined to show off the gane to advantage. One evening a quarrel arose from some dispute in the game, and there was a great row, and it was feared there would be a fight about it-not two men only, but a yarty of a dozen or twenty on cach side, a regular battle with knives and krisses; but after a large amount of talk it passed ofl quietly, and we heard nothing about it afterwards.

Most Europeans being gifted by nature with a luxuriant growth of hair upon their faces, think it disfigures them, and keep up a continual struggle against her by mowing down every morning the crop which has sprouted up during the preceding twenty-four hours. Now the men of Mongolian race are, naturally, just as many of us want to be. They mostly pass their lives with faces as smooth and beardless as an infant's. But shaving seems an instinct of the hmman race; for many of these people, having no hair to take off their faces, shave their heads. Uthers, however, set resolutely to work to force mature to give them a heard. One of the chiet cock-fighters at Dobbo was a Javanese, a sort of master of the cevemonies of the ring, who tied on the spurs and acted as backer-up to one of
the combatants. This man had suceeded, by assiduous cultivation, in raising a pair of monstaches which were a triumpli of art, for they each contaned ahout a tozen hairs more than three inches long, and which, loeing well greased and twisted, were distinetly visible (when not too far ofl) as a black thread hanging down on eath side of his mouth. But the beard to match was the difticulty, for nature had cruelly refused to give him a rudiment of hair on his chin, and the most talented gardener could not do much if he had mothing to cultivate. But true genins triumphs over diflicalties. Although there was no hair proper on the chin, there happened to be, rather on ons side of it, a sumbld mole or freekle which comatned (as such things frequently do a few stray hairs. These had been made the most of. They had reached four or five inches in leugth, and formed another black threand dangling from the left angle of the chin. The owner carried this as if it were something remarkable (as it certainly was) ; he often lelt it affectionately, passed it between his fiugers, and was evidently extremely pomi of his monstaches and beard!

One of the most sumpising things connected with Aru was the excessive cheapuess of all artiches of Europran or native manulacture. We were here two thousand miles beyond Singapore and Batavia, which are thenselves enporiums of the "far east," in a place nnvisited by, and almost unknown to, European traders; everything reauled us through at least two or three hands, often many wore; yet English calicoes and American cotton cloths could be bought for 8 s , the piece, muskets for $15 s$, common seissors and German knives at three-halfpence each, and other cutlery, cotton goods, and earthenware in the same proportion. The natives of this ont-of-the-way comitry can, in fact, buy all these things at about the same money price as our workmen at homse, but in reality very much cheaper, for the produce of a few hours' labour emables the savage to purchase in abundance what are to him luxuries, while to the European they are necessaries of life. The barharian is no lappier and no better off for this cheapness. On the contrary, it has a must injurions etfect on him. He wants the stimulus of uecessity to
force him to labur ; anl if irm were as dear as silver, and calico as costly as satin, the effect would be beneficial to him. Is it is, he has more ille hours, gets a more constant supply of tobaceo, and can intoxicate himself with arraek more frequently and more thoroughly ; for your Arm matn scoms to get half drumb-a tumbler finll of arrack is but a slight stimulus, and nothing less than half a gratlon of spirit will make him tipsy to his own satisfaction.

It is not agreable to reflect on this state of things. At least half of the vast multitudes of uncivilized peoples, on whom our gigatic manufacturing system, ebormous capital, and intense competition force the proluce of our looms and workshops, would be not a whit worse off physically, and would certainly be improved morally, if atl the articles with which we supply them were double or treble their present prices. If at the same time the difference of cost, or a large portion of it, could find its way into the prekets of the manufacturing workmen, thousands would he raised from want to comfort, from starvation to health, and would be removed from one of the chief incentives to crime. It is difficult for an Englishman to avoid contemplating with pride our gigantic and ever-increasing manufactures and commerce, and thinking everything good that renders their progress still more rapid, either by lowering the price at which the articles can be produced, or hy discovering new markets to which they may be sent. if, however, the question that is so frequently asked of the votaries of the less popular sciences were pat here-"Cui bono?"-it would be found more difficult to answer than had been imagined. The advantages, even to the lew who reap them, would be seen to be mostly physical, while the wide-spread moral and intelfectual evils resulting from unceasing labour, low wages, crowded dwellings, and monotonous oceupations, to perhaps as large a number as those who gain any real advantage, might be held to show a balance of evil so great, as to lead the greatest aduirers of our manufactures and commerce to cloubt the advisability of their further development. It will be said: "We camot stop it; capital must be employed; our population must be kept at work; if we hesitate a moment, wher nations now had
pressing us will get ahead, and national ruin will follow." Some of this is true, some fallacious. It is undoubtedly a dilficult problen which we have to solve; and 1 am inclined to think it is this diftieulty that makes men conclude that what seems a necessary and unalterible state of things must be good-that its benelits must be greater than its evils. This was the feeling of the American advocates of slavery; they could not see an casy, comfortable way out of it. In our own case, howerer, it is to be hoped, that if a fair consideration of the matter in all its bearings shows that a preponderance of eval arises fom the immensity of our manufactures and commerce-evil which must go on increasing with their increase-there is enough both of political wisdom and true phikathropy in Englishmen, to induce them to turn their smperabundant wealth into other channels. The fact that has led to these remarks is surely a striking one: that in one of the most remote comers of the earth saviges can buy clothing cheaper than the people of the country where it is suade; that the weaver's ehild should shiver in the wintry wind, unable to purchase articles attamale by the wild matives of a tropical climate, where clothing is mere ornament or luxury, should make us pause ere we regard with unmixed admiation the system which has led to such a result, and cruse us to look with some suspicion on the further extension of that system. It must be remembered too that our commerce is not a purely matual growth. It has been ever fustered by the legislature, and fored to an unnatural luxuriance by the protection of our tlects and armies. The wisdom and the justice of this policy have been already doubted. So soon, therefore, as it is seen that the further extension of our manutactures and commerce would be an evil, the remedy is not far to seek.

After six weeks' confmement to the house I was at length well, and could resume my daily walks in the forest. I did not, however, find it so productive as when I had first arrived at Dobbo, There was a damp stagnation about the paths, and insects were very scarce. In some of my best collecting places I now found a mass of rottiug wood, mingled with young shouts, and overgrown
with chmbers, yet I always managed to add snmething daily to my patensive collections. I one day mot with a carious example of finifure of instinct, whieh, by showing it to be fallible, renders it very doubtul whether it is anything more than hereditary habit, dependent on delicate modifications of sensation. Some sailors eut down a roob-sized tree, and, as is always my practice. I visited it daily for some time in seareh of insects. Among other beetles catme swarms of the little cylimirical wond-borers (Phatypus, Tesserocerus, Sc.), and commenced making holes in the bark. Altur a day or two I was surprised to find hundeds of them sticking in the holes they hatd hored, and on examination discovered that the milliy sap of the tree was of the nature of gutta-percha, hardening rapidly on expmsure to the air, and glucing the little anmals in self-dug graves. The halat of boring holes in trees in which to deposit their eygs, was not accompanied by a sufficient instinetive knowledge of which trees wore suitable, and which destructive to them. If, as is very probable, these trees have an attractive odour to certain species of borers, it might very likely lead to their beconing extinct; while other species, to whom the stme odour was disagreenble, and who therefore avoided the dangerous trees, would survive, and would be credited by us with an instinct, whereas they would really be guided by a simple sensation.

Those curious little beethes, the Brenthide, were very abundant in Aru. The females have a pointed rostrum, with which they bore deep holes in the bark of dead trees, often burying the rostron up to the eyes, and in these boles deposit their eggs. The males are larger, and have the rostrum dilated at the erd, and sometimes terminating in a good-sized pair of jaws. I once saw two males fighting togethur ; cach had a fore-leg laid across the neck of the other, and the rostrum bent quite in an attitude of defiance, and looking most ridiculous. Another time, two were fightimy for a femake, who stood close by busy at her boring. They pusbed at each other with their rostan, and chawed and thmoped, apparently in the greatest rage, although their coats of mat must have saved bouth from injury. The small ont, however, soon ran away, acknowledging himself vanquished. In most Culeoptera the
female is larger than the male, and it is therefore intoresting, as bearing on the question of sexual selection, that in this case, as in the stag-bretles where the nales fight together, they should be not ouly better armed, but also much larger than the females.

Just as we were going away, a handsome tree, allind to Frythrina, was in blossom, showing its masses of larye crimson flowers seattered here and there about the forest. Could it have been seen from an elevation, it would have had a fine effect; from below I could only catch sight of masses of gorgeous colour in clusters and festoons werhead, about which flocks of blue and orange lories were fluttering and screaming.

A good many people died at Dobbo this season; I believe about twenty. They were hmied in a little grove of Casuarinas behind my house. Among the tradors was a Mahometan priest, who superintended the funcrals, which were very simple. The body was wrapped up in new white cotton cloth, nod was carried on a bier to the grave. All the spectators sat down on the groumd, and the priest chanted some verses from the Koran. The grawes were fenced rond with a slight bamboo railing, and a little carved wooden lead-post was put to nurk the spot. There was also in the villare a sumall mosiue, where every Friday the thithful went to pray. This is probably more
remote frow Mecea than any other mosque in the world, and marks the farthest eastern extension of the Mahometan religion. The Chinese here, as mewhere, showed their superior wealth and civilization by tombstones of solid granite brourlat from Singapore, with deeply-cut inscriptions, the characters of which are painted in ret, blue, and gold. No people hase more respect for the graves of their relations and friends than this strange, ubiquitous, money-getting people.

Soon after we had returned to Dobbo, my Macassar boy, Paterom, took his wares and left me, because I scolded him for laziness. He then oceupied himself in gambling, and at first had some luck, and bought omaments, and had plenty of money. Then his luck turued; he lost everything, borrowed money and lost that, and was obliged to lecome the slave of his creditor till he had worked out the delot. He was a quick and active lat when he pleased, but was apt to be idle, and had such an incorrigible propensity for gambling, that it will very likely lead to his becoming a slave for life.

The end of Jume was now approaching, the east monsoon had stt in steadily, aml in another week or two Dobbo would he deserted. Preparations for departure were everywhere visible, and every sunny day (rather rate now) the streets were as crowled and as busy as leehives. Heaps of tripang were fimally dried and packed up in sacks; mother-of-pearl shell, tied up with rattaus into convenient bundles, was all day long heing caried to the beach to be loated: water-casks were filled, and cloths and mat-sails mented and strengthened for the run home before the strong east wind. Almost every day groups of natives arived from the most distant parts of the islauls, with cargocs of bananas and sugar-cane to exchange for tobacco, sago, bread, and other luxuries, before the general departure. The Chinamen killed their fat pig and made their parting feast, and kindly sent me some pork, and a basin of birds'-nest stew, which had very little more taste than a dish of vermicelli. My boy Nli returned froms Wammbai, where I had sent him alone for a fortnight to buy l'aralise birds and prepare the skins; he brought me sixteen glorious specimens, and had he not been very
ill with fever and ague might have obtained twice the number. He had lived with the people whose house I had occupied, and it is a proof of their goodness, if fairly treated, that although he took with him a quantity of silver dollars to pay for the birds they caught, no attempt was made to rob him, which might have been done with the most perfect impunity. He was kindly treated when ill, and was brought back to me with the balance of the dollars he had not spent.

The Wanumbai people, like almost all the inhabitants of the Aru Islands, are perfect savnges, and I saw no signs of any religion. There are, however, three or four villages on the coast where schoolmasters from Amboyna reside, and the people are nominally Christians, and are to some extent educated and civilized. I could not get much real knowledge of the customs of the Aru people during the short time I was among them, but they have evidently been considerably influenced by their long association with Mathometan traders. They often bury their dead, although the national custom is to expose the body on a raised stage till it decomposes. Though there is no limit to the number of wives a man may have, they seldom exceed one or two. A wife is regularly purchased from the parents, the price being a large assortment of articles, always including gongs, crockery, and cloth. They told me that some of the tribes kill the old men and womeu when they can no longer work, but I saw many very old and decrepid people, who seemed pretty well attended to. No doult all who have much intercourse with the Bugis and Ceramese traders gradually lose many of their mative customs, especially as these people often settle in their villages and marry native women.

The trade carried on at Dobbo is very considerable. This year there were fifteen large praus from Macassar, and perhaps a hundred small boats from Ceram, Goram, and Ké. The Macassar cargoes are worth about 1,000 d. each, and the other boats take away perbaps about 3,000 . worth, so that the whole exports may be estimated at $18,060 \mathrm{l}$. per annum. The largest and most bulky items are pearl-shell and tripang, or "hêche-de-mer," with smalier quantities of tortoise-shcll, edible birds' nests, pearls, orna-
mental woods, timber, and Birds of Paradise. These are purchased with a variety of grools. Of arrack, about equal in strensth to ordinary West India rum, 3,000 boxes, each containing fifteen half-gallon bottles, are consumed amuually. Native cloth from Celebes is much esteemed for its durability, and large quantities are sold, as well as white English calico and American unbleached cottons, common crockery, coarse cutlery, muskets, gunpowder, gongs, small brass cannon, and clephants' tusks. These three last articles constitute the wealth of the Aru people, with which they pay for their wives, or which they hoard up as "real property." Sobaceo is in immense demand for chewing, and it must be very strong, or an Aru man will not look at it. Knowing how little these people gencrally work, the mass of produce obtained annually shows that the islands must be pretty thickly inhabited, especially along the coasts, as nine-tenths of the whole are marime productions.

It was on the 2 d of July that we left Aru, followed by all the Macassar praus, fifteen in number, who had agreed to sail in company. We passed south of Banda, and then steered due west, not seeing land for three days, till we sighted some low islauds west of Bouton. We had a strong and stealy south-east wind day and night, which carriel us on at about five knots an hour, where a clipper ship would lave made twelve. The sky was continually cloudy, dark, and threatening, with occasional drizzling showers, till we were west of Bourn, when it cleared up and we enjoyed the bright sunay skies of the dry season for the rest of our voyage. It is about here, therefore, that the seasons of the castern and western regions of the Archipelago are divided. West of this line from June to December is generally fine, and often very dry, the rest of the year being the wet season. East of it the weather is exceedingly moertain, each island, aud each side of an island, having its own peculiarities. The difference seems to consist not so much in the distribution of the rainfall as in that of the clouds and the moistness of the atmosphere. In Aru, for example, when we left, the little streams were all dried up, although the weather was gloeny; while in January, February, and March, whes we
had the hottest sunshine and the finest days, they were always flowing. The driest time of all the year in Aru occurs in September and October, just as it does in Java and Celebes. The rainy seasons agree, therefore, with those of the western islands, although the weather is very different. The Molucca sea is of a very deep blue colour, quite distinct from the clear light blue of the Atlantic. In cloady and dull weather it looks absolutely black, and when crested with foam has a stern and angry aspect. The wind continued fair and strong during our whole voyage, and we reached Macassar in perfect safety on the evening of the 11th of July, having made the passage from Aru (more than a thousand miles) in nine and a half days.

My expedition to the Aru Islands had been eminently successful. Although I had been for months confined to the house by illness, and had lost much time by the want of the means of locomotion, and by missing the right season at the right place, I brought away with me more than nine thousand specimens of natural objects, of about sixteen hundred distinct species. I had made the acquaintance of a strange and little-known race of men; I laad become familiar with the traders of the far East; I had revelled in the delights of exploring a new fauna and flora, one of the most remarkable and most beautiful and leastknown in the world; and I had succeeded in the main object for which I had undertaken the journey-namely, to obtain fine specimens of the maguificent Birds of Paradise, and to be enabled to observe them in their native forests. By this success I was stimulated to continue my researches in the Moluccas and New Guinea for nearly five years longer, and it is still the portion of my travels to which I look back with the most complete satisfaction.

## CHAPTER XXXIII.

tien alu islands.-physical geography and aspects OF NATUIE

IN this chapter I propose to give a general sketch of the physical geography of the Aru Islands, and of their relation to the surrounding countries; and shall thus be able to incorporate the information obtaned from traders, and from the works of other maturalists, with my own observations in these exceedingly interesting and littleknown regions.

The Aru group may be said to consist of one very large central island with a number of small ones scattered round it. The great island is called by the natives and traders "Tana-bŭsar" (great or mainland), to distinguish it as a whole from Dobbo, or any of the detached islands. It is of an irregular oblong form, about eiglity miles from north to south, and forty or filty from east to west, in which direction it is traversed by three narrow chamnels, dividing it into four portions. These chamels are always called rivers by the traders, which puzzled me much till I passed through one of them, and saw how exceedingly applicable the name was. The northern ehannel, called the river of Watelai, is about a quarter of a mile wide at its entrance, but soon narrows to about the eighth of a mile, which width it retains, with little variation, during its whole length of nearly fifty miles, till it again widens at its eastern mouth. Its course is moderately winding, and the banks are generally dry and somewhat elevated. In many places there are low cliffs of havd coralline limestone, more or less worn by the action of water; while sometimes level spaces extend from the banks to low ranges of hills a little inland. A few small streams enter it from right and left, at the mouths of which we some little rocky islands. The depth is very regular, being from ten to tifteen fathoms, and it has thus every feature of a true river, but for the salt water and the absence of a current. The other two rivers,
whose names are Vorkai and Maykor, are said to be very similar in general character; but they are rather near together, and have a number of cross channels intersecting the flat tract between them. On the south side of Maykor the banks are very rocky, aud from thence to the southern extremity of Aru is an uninterrupted extent of rather elevated and very rocky country, penetrated by numerous small streams, in the high limestone cliffs bordering which the edible birds' nests of Aru are chiefly obtained. All my informants stated that the two southern rivers are larger than Watelai.

The whole of Aru is low, but by no means so flat as it has been represented, or as it appears from the sea. Most of it is dry rocky ground, with a somewhat undulating surface, rising here and there into abrupt hillocks, or cut into steep and narrow ravines. Except the patches of swamp which are found at the mouthis of most of the small rivers, there is no absolutely level ground, although the greatest elevation is probably not more than two hundred feet. The rock which everywhere appears in the ravines and brooks is a coralline limestone, in some places soft and pliable, in others so hard and crystalline as to resemble our mountain limestone.

The small islands which suround the central mass are very numerous; but most of them are on the east side, where they form a fringe, often extending ten or fifteen miles from the main islands. On the west there are very few, Wamma and Pulo Babi being the chief, with Ougia and Wassia at the north-west extremity. On the east side the sea is everywhere shallow, and full of coral; and it is here that the pearl-shells are found which form one of the chiel staples of Aru trade. All the islands are covered with a dense and very lofty forest.

The physical features here described are of peculiar interest, and, as far as I am aware, are to some extent unique; for I have been umable to find any other record of au island of the size of Aru crossed by channels which exactly resemble true rivers. How these channels originated were a complete puzze to me, till, atter a long consideration of the whole of the natural phenomena presented by these islands, 1 arrived at a couclusion which I will now
endeayour to explain. There are three ways in which we may conceive islands which are not voleanic to have been formed, or to have been reduced to their present condition, -by elevation, by subsidence, or by separation from a continent or larger island. The existence of eoral rock, or of raised beaches far inland, indicates recent elevation ; lagoon coral-islands, and such as lave bartier or encircling reets, have suffered subsidence; while our own islands, whose productions are entirely those of the atjacent continent, have heen separated from it. Now the Aru Islands are all coral rock, and the adjacent sea is shallow and full of coral ; it is therefore evident that they have lieen elevated from beneath the ocean at a not very distant epoeh. But if we suppose that elevation to be the lirst and only atase of their present condition, we shall find ouselves quite unable to explain the eurions river-channels which divide them. Fissures during upheaval would not produce the regular width, the regular depth, or the winding curves which characterise them; and the action of tides and currents durimg their elevation might form straits of irregular width and depth, but not the river-like channels which actually exist. If, arain, we suppose the last movement to have been one of sulsidence, reducing the size of the islands, these channels are quite as inexplicahle; for subsidence wouhl necessarily lead to the flooding of all low tracts on the banks of the old rivers, and thus obliterate their courses; whereas these remain perfect, and of nearly uniform width from end to end.

Now if these channcls have ever been rivers they must have tlowed from some higher regions, and this most have been to the east, becanse on the north and west the seabottom siuks down at a short distance from the shore to an untathomable deptl; whereas on the east a shatlow sea, wowhere exceeding fifty fathoms, extends quite across to New Guinea, a distance of about a hundred and fifty miles. An clevation of only three lundred feet would convert the whole of this sta into moderately high land, and make the Aru Islands a portion of New Guinea; and the rivers which Lave their months at Utauata and Wamuka, might then Lave flowed on across Aru, in the channels which are now occupied by salt water. When the intervening land
sunk down, we must suppose the land that now constitutes Aru to lave remained nearly stationary, a not very improbable supposition, when we consider the great extent of the shallow sea, and the very small amount of depression the land need have undergone to produce it.

But the fact of the Aru Islands having once been connected with New Guinea does not rest on this evidence alone. There is such a striking resenblance between the productions of the two countries as only exists between portions of a common teritory. I collected one hundred species of land-birds in the Aru Ishands, and about eighty of them have been found on the mainland of New tainea. Among these are the great wingless cassowary, two species of heavy brush turkeys, and two of short winged thrushes, which could certainly not have passed over the 150 miles of open sea to the coast of New Guinea. This barier is equally effectual in the case of many other binds which live only in the depths of the forest, as the kinghunters (Dacelo gaudichandi), the fly-catching wreus (Torlopsis), the great crown pigeon (Goura coronata), and the small wood doves (l'tilonopus perlatus, P. aurantiifrons, and P'. coronulatus). Now, to show the real effect of such a barrier, let us take the island of Ceram, which is exactly the same distance from New Guinea, but separated from it by a deep sea. Out of about seventy land-birds inhabiting Ceram, only fifteen are found in New Guinea, and none of these are terresirial or forest-hannting species. The cassowary is distinct; the kingfishers, parrots, pigeons, llycatchers, honeysuckers, thrushes, and cuckoos, are almost always quite distinct species. More than this, at least twenty genera, which are common to New Guinea and Aru, do not extend into Ceram, indicating with a force which every naturalist will appreciate, that the two latter countries have received their faunas in a radically different mamer. Again, a true kangaroo is found in Arn, and the same species occurs in Mysol, which is equally Hapuan in its productions, while either the same, or one closely allied to it, inhabits New Guinea; but no such animal is found in Ceram, which is only sixty miles from Mysol. Another small marsupial animal (Permmeles doreyanus) is common to Aru and New Guinea. The insects show exactly the
same results. The buttertlies of Aru are all either New Guinea species, or very slightly modified forms; whereas those of Ceram are more distinct than are the birds of the two countries.

It is now generally admitted that we may safely reason on such facts as these, which supply a link in the defective geological record. The upwand and downward movements which any country las undergone, and the succession of such movements, ean be determined with much accuracy ; but geolony alone can tell us nothing of lauds which have entirely disappeared beneath the ocean. Here physical geography and the distribution of animals and plants are of the greatest service. By ascertaining the depth of the seas scparating one country from another, we can form some judgment of the clanges which are taking place. If there are other evidences of subsidence, a shallow sea maplies a former connexion of the adjacent lands; but if this evidence is wanting, or if there is reason to suspect a rising of the land, then the shallow sea may be the result of that rising, and may indicate that the two countries will be joined at some future time, but not that they have previously been so. The nature of the animals and plants inhabiting these countrics will, however, aluost always enable us to determine this ruestion. Mr. Darwiu has shown us how we way determine in almost every case, whether an island has ever been connected with a continent or larger land, by the presence or abseuce of terrestrial Mammalia and reptiles. What he terms "oceanic islands" possess weither of these groups of animals, though they may have a luxuriant vegetation, ind a fair number of lirds, insects, and land-shells; and we therefore conclude that they have originated in mid-ocean, and have never been counected with the nearest masses of land. St. Helena, Madeira, and New Zealand are examples of oceanic islands. They possess all other classes of life, because these have meaus of dispersion over wide spaces of sea, which terrestrial manmals and birds have not, as is fully explaned in Sir Charles Lyell's "Prineiples of Geology," and Mr. Darwin's "Origin of species." On the other hand, an island may never have been actually conneeted with the aljacent continents or islands, and yet
may possess representatives of all classes of animals, because many terrestrial mammals and some reptiles have the means of passing uver short distances of sea. But in these cases the number of species that have thas migrated will be very small, and there will be great deficiencies even in birds and llying insects, which we should imarine could easily cross over. The island ol Tinor (as I have already shown in Chapter XIIL.) bears this relation to Australia; for while it contains several birds and insects of Australian forms, no Austretian nammal or reptile is found in it, and a great mumber of the most abundant and characteristic forms of Australian birds and insects are entirely absent. Contrast this with the British Islauds, in which a large proportion of the plants, insects, reptiles, and Mammalia of the adjacent parts of the continent are fully represented, while there are no remakable deficiencies of extensive groups, such as always oceur when there is reason to belitve there has been no such connexion. The case of Sumatra, Borneo, and Java, and the Asiatic contivent is equally clear ; many large Mammalia, terrestrial birds, and reptiles being common to all, while a large number more are of closely allied forms. Now, geology has taught as that this representation by allied forms in the same docality implies lapse of time, and we therefore infer that in Great Dritain, where almost every species is absolutely identical with those on the Continent, the separation has been very recent; while in Sumatra and Java, where a considerade number of the contincutal species are represented by allied forms, the separation was more remote.

From these examples we may see how important a supplement to geological evidence is the study of the geographical distribution of animals and plants, in determining the former condition of the earth's surface; and how impossible it is to understand the former without taking the latter into account. The productions of the Aru Islands offer the strongest evidenee that at no very distant epoch they formed a part of New Guinea; and the peculiar physical features which I have described, indicate that they must have stood at very nearly the same level then as they do now, having been separated
by the subsidence of the great plain which formerly connected them with it.

Persons who have formed the usual ideas of the vegetation of the tropics-who picture to themselves the abundance and brilliancy of the flowers, and the marnificent appearance of hundreds of forest trees covered with masses of coloured blossoms, will be surprised to hear, that though vegetation in Aru is highly luxuriant and varied, and would afford abundance of fine and curious plants to adorn our hothouses, yet bright and showy flowers are, as a general rule, altogether absent, or so very scarce as to produce no effect whatever on the getieral scenery. To give particulars: I hove visited five distinet localities in the islands, I have wandered daily in the forests, and have passed along upwards of a hundred miles of coast and river during a period of sir montls, much of it very fine weather, and till just as I was about to leave, I never saw a single plant of striking brilliancy or beauty, hardly a shrub equal to a hawthorn, or a climber equal to a honeysuckle! It camot be said that the flowering season had not arrived, for I saw many herbs, shrubs, and forest trees in flower, but all had blossoms of a green or greenish-white tint, not superior to our lime-trees. Here and there on the river banks and coasts are a few Convolvulacere, not equal to our garden Ipomars, and in the deepest shades of the forest some fine scarlet and purple Zingiberacee, but so few and scattered as to be nothing amid the mass of grees and Howerless veretation. Tet the noble Cycadacee and serew-pines, thirty or forty feet high, the elegant tree ferns, the lofty palms, and the variety of beautitul and curious plants which everywhere meet the eye, attest the warmth and moisture of the tropics, and the fertility of the soil. It is true that Aru seemed to me exceptionally poor in flowers, but this is only an exaggeration of a general tropical feature; for my whole experience in the equatorial regions of the west and the east has convinced me, that in the most luxuriant parts of the tropics, flowers are less abundant, on the average less showy, and are far less oflective in adding colour to the laudscape than in tempe-
rate climates. I have never seen in the tropics such billliant masses of colour as even England can show in her furze-clad commons, her heathery mountain-sides, her glades of wild hyacinths, her fields of poppies, her meadows of buttercups and orchises-carpets of yellow, purple, azurehlue, and fiery crimson, which the tropics cau rarely exhibit. We have smaller masses of colour in our hawthorn and crab trees, our holly and mountain-ash, our broom, foxgloves, primroses, and purple vetches, which clothe with gay colours the whole length and breadth of our land. These beauties are all common. They are characteristic of the country and the climate; they have not to be sought for, but they gladden the eye at every step. In the regions of the equator, on the other hand, whether it be forest or savanuah, a sombre green clothes universal nature. You may journey for hours, and even for days, and meet with nothing to break the monotony. Flowers are everywhere rave, and anything at all striking is only to be met with at very distant iutervals.

The idea that nature exhibits gay colours in the tropics, and that the general aspect of nature is there more bright and varied in hue tlan with us, has even been made the foundation of theories of art, and we have been forbidden to use bright colours in our garments, and in the decorations of our dwellings, becanse it was suppesat that we should be thereby acting in opposition to the teachings of nature. The argument itself is a very poor one, since it might with equal justice be maintained, that as we possess taculties for the appreciation of colours, we should make up for the deficiencies of nature and use the gayest tints in those regions where the landscape is most monotonous. Put the assumption on which the argument is founded is totally false, so that even if the reasoning were valid, we need not be afraid of outraging nature, by decorating our houses and our persons with all those gay hues which are so lavishly spread over our fields and mountains, our hedges, woods, and meadows.

It is very easy to see what has led to this erroneous yiew of the nature of tropical vegetation. In our bothouses and at our flower-shows we gather together the finest flowering plants from the most distant regions of
the earth, and exhilit them in a proximity to each other which never occurs in nature. A hundred distinct plants, all with bright, or strange, or gorgeous flowers, make a wonderful show when brought together; but perhaps no two of these plants could ever be seen together in a state of nature, each inhabiting a distant revion or a different station, Again, all moderately warm extraEuropean countries are mixed up with the tropics in general estimation, and a vague idea is formed that whatever is pre-eminently beautiful matst come from the hottest parts of the earth. But the fact is quite the contrary. Rhododendrons and azaleas are plants of temperate regions, the graudest lilies are from temperate Japan, and a large proportion of our most showy llowering plants are natives of the Himalayas, of the Cape, of the United States, of Chili, or of China and Japan, all temperate regions. True, there are a great number of grand and gorgeous llowers in the tropics, but the proportion they hear to the mass of the vegetation is exceedingly small; so that what appears an anomaly is nevertheless a fact, and the effect of flowers on the general aspect of nature is far less in the equatorial than in the temperate regions of the earth,

## CHAPTER XXXIV.

NEW GUINEA.-DOREY.
(3atch to jtly 1858.)

AFTER my return from Gilolo to Ternate, in March 1858, I mide arrangements for my long-wished-for voyage to the mainland of New Guinea, where I anticipated that my collections would suppass those which I had formed at the Aru Isfands. The poverty of Ternate in articles used by Europeans was shown, by my searching in vain through all the stores for such common things as

Hour, metal spoons, wide-monthed phials, beeswax, a penknife, and a stone or metal pestle and mortar. I took with me four servants: my heal man Ali, and a Ternate lad named Junaat (Friday), to shoot; Lahagi, a steady middleaged man, to cut timber and assist me in insect-collectin!; and Loisa, a Javanese cook. As I knew I should bave to build a house at Dorey, where I was going, I took with me eighty cadjans, or waterproof mats, made of pandanus leaves, to cover over my baggage on tirst landing, and to help to roof my house afterwards.

We started on the $2 \overline{t h}$ of Mareh in the schooner Hester Helena, belonging to my friend Mr. Duivenboden, and bound on a trading voyage along the noth coast of New Guinea. Having calms and light airs, we were three days reachiug Gane, near the south end of Gilolo, where we stayed to fill up our water-casks and buy a few provisions. We obtained fowls, egrss, sago, plantains, sweet potatoes, yellow pumpkins, chilies, fish, and dried deer's meat; and on the afternom of the $29 t \mathrm{~h}$ proceeded on our voyage to Dorey harbour. We found it, however, by no means easy to get nlong; for so near to the equator the monsoons entirely fail of their regularity, and after passing the southern point of Gilolo we had calms, light puffs of wind, and contrary currents, which kept us for five days in sight of the same islands between it and Poppa. A squall then brought us on to the entrance of Dampier's Straits, where we were again becalmed, and were three more days creeping through them. Several native canoes now came ofl' to us from Waigiou on one side, and Batanta on the other, bringing a few common shells, paln-leaf mats, cocoa-ruts, and pumpkins. They were very extravagant in their demands, being accustomed to sell their trifles to whalers and China ships, whose crews will purchase anything at ten times its value. My only purchases were a iloat belonging to a turtle-spear carved to resemble a bird, and a very well made palm-leaf box, for which articles I gave a copper ring and a yard of calico. The canoes were very narrow and furnished with an outrigger, and in some of them there was only one man, who seemed to think nothing of coming out alone eight or ten miles
from shore. The people were Papuans, much resembling the natives of Aru.

When we had got out of the Straits, and were fairly in the great Pacific Ocean, we had a steady wind for the first time since leaving Ternate, but unfortunately it was dead ahead, and we had to beat against it, tacking on and olf the coast of New Guinea. I looked with intense interest on those rugged mountains, retreating ridge behind ridge into the interior, where the foot of civilized man hitd never trol. There was the country of the cassowary and the trec-kangaroo, and those dark forests produced the most extraordinary and the most beautiful of the feathered inhabitants of the earth-the varied species of Bivds of Paralise. A few days more and I hoped to be in pursuit of these, and of the scarcely less beautiful insects which accompany them. We had still, however, for several days only calms and light head-winds, and it was not till the 10th of April that a fine westerly breeze set in, followed liy a squally night, which kept us off the entrance of Dorey larbour. The next morning we entered, and came to auchor off the small island of Mansinam, on which dwelt two German missionaries, Messrs. Otto and Geisler. The former immediately came on boand to give us welcome, and invited us to go on shore and breaklast with him. We were then introduced to his companion-who was suffering dreadfully from an abscess on the heel, which lad conlined him to the house for six months-and to his wife, a young German woman, who had been out only three months. Unfortunately she could speak no Malay or English, and had to guess at our compliments on her excellent breakfast by the justice we did to it.

These nuissiouaries were working men, and had been sent out, as being more useful among savages than persons of a ligher class. They had been here about two years, and Mr. Otto had already learnt to speak the Papuan language with fluency, and had begun translating some portions of the Bible. The language, however, is so poor that a considerable number of Malay words have to be used; and it is very questionable whether it is possible to convey any idea of such a book, to a people in so low a state of civilization. The only nominal converts yet made are a
few of the women; and some few of the children atteul school, and are being taught to read, but they make little progress. There is one feature of this mission which I believe will materially interfere with its moral effect. The missionarics are allowed to trade to eke out the very small salaries granted them from Europe, aud of course are obliged to cancy out the trade principle of buyins cheap and selling dear, in order to make a profit. Like all savages the natives are quite careless of the future, and when their small rice crops are gathered they bring a large portion of it to the missionaries, and sell it for knives, beads, axes, tobacco, or any other articles they may require. A few months later, in the wet season, when food is scarce, they come to buy it back again, and give in exchange tortoiseshell, tripang, wild nutmegs, or other produce. Of course the rice is sold at a much higher rate than it was bought, as is perfectly fair and just-and the operation is on the whole thoroughly beneficial to the natives, who would otherwise consume and waste their food when it was abundant, and then starve-yet I cannot inagine that the natives see it in this light. They must look upon the trading missionaries with some suspicion, and cannot feel so sure of their teachings being disinterested, as would be the case if they acted like the Jesuits in Singapore. The first thing to be done by the missionary in attempting to improve savages, is to convince them by his actions that he comes among them for their beuefit only, and not for any private ends of his own. To do this he must act in a diflerent way from other men, not trading and taking advantage of the necessities of those who want to sell, but rather giving to those who are in distress. It would be well if he conformed himself in some degree to native customs, and then eudeavoured to show how these customs might be gradually modified, so as to be more healthfin and more agreeable, A few energetic and devoted men acting in this way might probably efleet a decided moral improvement on the lowest savage tribes, whereas trading missionarics, teaching what Jesus said, but not doing as He did, can scarcely be expected to do more than give them a very little of the superficial varnish of religivin,

Dorey harbour is in a tine bay, at one extremity of
which an elevated point juts out, and, with two or three small islawds, forms a sheltered anchorage. The only vessel it contained when we arnived was a Dutch brig, laden with coals for the use of a war-steaner, which was expected daily, on an exploring expedition along the coasts of New Guinca, for the purpose of fixing on a locality for a colony. In the evening we paid it a visit, and landed at the village of Dorey, to look out for a place where I conh fuild my house. Mr. Otto also made arrangements tor me with some of the native chiefs, to send men to cut wood, rattans, and bamboo the next day.

The villages of Msnsinam and Dorey presented some features quite new to me. The houses all stand completely in the water, and are reached by long rude bridges. They are very low, with the roof shaped like a Jarge boat, bottom upwards. The posts which support the houses, bridges, and platforms are small crooked sticks, placed without any regularity, and looking as if they were tumbling down. The floors are also formed of sticks, equally irregular, and so lonse and far apart that I fround it almost impossible to walk on them. The walls consist of bits of boards, old boats, rotten mats, attaps, and palu-leaves, stuck in anyhow here and there, and laving altogether the most wretched and dilapidated appearance it is possible to conceive. Under the caves of many of the houses hang hmman skulls, the trophies of their battles with the savage Arfaks of the interior, who often come to attack them. A large boat-shaped councilhouse is supported on larger posts, each of which is grossly carved to represent a naked male or female human figure, and other carvings still more revolting are placed upon the platform before the entrance. The vier of an ancient lake-dweller's village, given as the frontispiece of Sir Charles Lyell's "Antiquity of" Man," is chiefly founded on a sketch of this very village of Dorey; but the extreme regularity of the structures there depicted has no place in the original, any more than it probably had in the actual lake-villages.

The people who inhabit these miserable huts are very similar to the Ké and Aru islanders, and many of them are very handsome, being tall and well-made, with well-
cut features and large aquiline noses. Their colour is at deep brown often approaching closely to back, and the fine mop-like heads of frizaly hair appear to be more commen than clsewhere, and are considered a great ornanent, a loug six-pronged bamboo fork being kept stuck in them to serve the purpose of a comb; and this is assiduonsly used at idle moments to keep the densely growing

mass from becoming matted and tangled. The majority have short woolly hair, which does not stem capable of an equally luxuriant development. A growth of hair somewhat similar to this, and almost as cobundant, is found anong the half-breeds botween the Indian and Negro in Sonth Ameriea. Gian this be an indication that the Papuans are a mixed race?

For the linst thre days after our arrival I was fully ocenpied from unaing to night builiing a louse, with the
arsistance of a dozen laphans and my own men. It was immense tromble to get our labourers to work, as scarcely one of them could speak a word of Malay; and it was only by the most energetic gesticulations, and going through a regular pantomime of what was wanted, that we could get them to do anything. If we made them understand that a few more poles were required, which two could have easily cut, six or eight would insist upon going together, although we needed their assistance in other things. One morning ten of them came to work, bringing only one chopper between them, although they knew I had none ready for use. I chose a place about two hundred yards from the beach, on an elevated ground, by the side of the chief path from the village of Dorey to the provision-grounds and the forest, Within twenty yards was a little stream, which furnished us with excellent water and a nice place to bathe. There was only low underwood to clear away, while some fine forest trees stood at a short distance, and we cut down the wood for about twenty yards round to give us light and air. The house, about twenty feet by fifteen, was built entirely of wood, with a bamboo floor, a single door of thatch, and a large window, looking ever the sea, at which I fixed my table, and close beside it my bed, within a little partition. I bought a number of very large palm-leaf mats of the natives, which made excellent walls; while the mats I had brought myself were used on the root, aud were covered over with attaps as soon as we could get them mate. Outside, and rather behind, was a little hut, used for cooking, and a bench, roofed over, where my men could sit to skin birds and animals. When all was finished, I had my goods and stores brought up, arranged them conveniently inside, and then paid my Papuans with knives and chopers, and sent thom away. The next day our sehooner left for the more eustern islands, and I found inyself fairly established as the only Eurepean imhabitant of the vast island of New Guinea.

As we had some donlot thout the natives, we slept at first with loaded ghas lesside us and a wateh set; but adter a few days, timbing the people friendly, and lecting sure that they would not venture to attack tive well-armed men, we touk no liurther prectutions. We had still a day
or two's work in finishing up the house, stopping leaks, putting up our hanging shelves for drying specimens inside and out, and making the path down to the water, and a clear dry space in front of the house.

On the 17 th, the steamer not having arrived, the coalship left, having lain here a month, according to her contract; and on the same day my hunters went out to shoot for the first time, and brought home a magnificent crown pigeon and a few common birds. The next day they were more successful, and I was delighted to see them return with a Bird of Paradise in full plumage, a pair of the fine Papuan lories (Lorius domicella), four other lories and parroquets, a grackle (Gracula dumonti), a king-hunter (Dacelo gaudichaudi), a racquet-tailed kingfisher (Tanysiptera galatea), and two or three other birds of less beauty. I went myself to visit the native village on the hill behind Dorey, and took with me a small present of cloth, knives, and beads, to secure the good-will of the chief, and get him to send some men to catch or shoot birds for me. The houses were scattered about among rudely cultivated clearings. Two which I visited consisted of a central passage, on each side of which opened short passages, admitting to two rooms, each of which was a house accommodating a separate family. They were elevated at least fifteen feet above the ground, on a complete forest of poles, and were so rude and dilapidated that some of the small passages had openings in the floor of loose sticks, through which a child might fall. The inhabitants seemed rather uglier than those at Dorey villige. They are, no dould, the true indigenes of this part of New Gumea, liviner in the interior, and subsisting by cultivation and lunting. The Dorey men, on the other hand, are shore-dwellers. fishers and traders in a small way, and have dhas the character of a colony who lave mingated from another district. These hillmen or "Arfaks" diftered much in physical features. They were generally back, but some were hown like Malays. Their hatr, thongh always more or less frizaly, wes sometimes short and matted, instend of being long, loose, and woully; and this secmed to be a constitutional diffenere, wot the effer of care and cultisation. Nearly half of theth ware aftlicted with the seutiy

skin-disease. The oll chiet seened much pleased with his present, and pronised (through an interpreter I trought with me) to pro-
 tect my men when they came there shooting, and also to procure me some birds and animals. While conversing, they smoked tobacco of their own growing, in pipes cut from a single piece of wood with a long upright handle.

We had arrived at Dorey about the end of the wet season, when the whole country was soaked with moisture. The native paths wore so neglected as to be often mere tunnels closed over with vegetation, and in such places there was always a fearful accumulation of mud. To the maked Papuan this is no obstruction He wades through it, and the next watercourse makes him clean again; but to mysell, wearing boots and trousers. it was a most disigreeable thing to have to go up to my lnees in a mud-hole every moning. The man I brought witla me to cut wood fell ill soon after we arrived, or I would have set him to clear fresh paths in the worst places. For the first ten days it generally rained every afternown and all wight; but by going out every hour of tine weather, I managed to get on tolerably with my collections of hirds and insects, finding most of those collected hy Lesson during his visit in the Compille, as well as many new ones. It appears, however, that Dovey is not the phace for Pirts of Farmase, nome of the natives heing accustomed to puescre thens. Those sold here are all brondin from Amberhaki, ahout a hundred miles west, where the Doreyans go to trade.

The islands in the bay, with the low lands near the coast, seem to thave been formed by recently rused coral
reets and are much strewn with masses of coral bat little altered. The ridge behind my house, which runs out to the point, is also entirely coral rock, although there are sigus of a stratified fommation in the ravines, and the rock itself is more compact and erystallim. It is, therefore, probably older, a more recent elevation having exposed the low grounds aud ishands. On the other side of the bay rise the great mass of the Arfak mountains, said by the French navigators to be about ten thousund feet high, and inhabited by savage tribes. These are held in great dread by the Dorey people, who bave often been attacked and plundered by them, and have some ol their skulls hanging ontside their houses. If I was seen going into the furest anywhere in the direction of the mountains, the Jittle boys of the village would shout after me, "Arfaki! Arfaki!" just as they did after Lesson nearly forty years before.

On the 15th of May the Duteh war-steamer E/ne arrived; but, as the conls had gone, it was obliged to stay till they came back. The captain kuew when the coalship was to arrive, and how long it was chartered to stay at Dorey, and could have been back in time, but supposed it would wait for him, and so did not hurry hiuself. The steamer lay at anchor just opposite my honse, and I had the advantage of hearing the halfhouly bells struck, which was very pleasint after the monotonous silence of the forest. The captain, doctor, engineer, and some other of the officers paid me visits; the servants came to the brook to wash clothes, and the son of the Prince of Tidore, with one or two companions, to bathe; otherwise I saw little of them, and was not disturbed by visitors so much as I had expected to be. About this time the weather set in pretty fine, but neither birds nor insects became much more abundant, and new birds were very scarce. None of the Birds of Paradise except the common one were ever met with, and we were still searching in vain for several of the fine birds which Lesson had obtained here. Insects were tolerably abundant, but were not on the average so fine as those of Amboyna, and I reluctantly came to the conclusion that Dorey was not a good collecting locality. Buttertlies were
very senree, and were mostly the same as those which i lad ebtained at Aru.

Among the insects of other orders, the most curious and novel were a group of horned dies, of which I obtained four distinet species, settling on fallen trees and decaying trunks. These remarkable insects, which have been deseribed by Mr. W. W. Saunders as a new genus, under the name of Elaphomia or deer-flies, are about half an inch long, slender-bodied, and with very long legs, which they draw together so as to elevate their bodies higla above the surface they are standing upon. The front pair of legs are much shorter, and these are often stretched directly forwards, so as to resemble antenne. The horns spring from beneath the eye, and seem to be a prolongation of the lower part of the orbit. In the largest and most singular species, named Elaphomia cervicornis or the stor-

HORSED FT,HFM
Filaphonla cervicornis. E. brevicarnls.

Elaphomis waincei. E. alcicornis.
lomed deer-lly, these horns are nearly as long as the body, laving two branches, with two small smags near their lifurcation, so as to resemble the horns of a stag. They ate black, with the tips pale, while the body and legs are yellowish brown, and the cyes (when alive) violet and green. The next species (Elaphomia wallacei) is of a dark brown colour, banded and spotted with yellow. The horns are nhout one-third the length of the insect, broad, flat, and of an elongated triangular form. They are of a beautiful
pink colotr, edred with hack, and with a pale central stripe. The front part of the hean is also pink, and the eyes violet pink, with a green stripe across them, givinu the insect a very elegant and simgular appearance. The third species (Eliphomia alcicornis, the elk-homed deer-fly) is a little smaller than the two already described, but resembling in colour Elaphomia wallacei. The horns are very remarkable, being suddenly dilated into a that plate, strongly toothed round the onter margio, fud strikingly resembling the horns of the ells, after which it has heen named. They are of a yellowish colour, margined with brown, and tipped with black on the three uller teeth. The fourth species (Shaphomia brevicornis, the shorthomed deer-fly) (liffers considerably from the rest. It is stouter in form, of a nearly back colour, with a yellow ring at the base of the abdomen; the wings have dusky stripes, and the heat is compressed and dilated laterally, with very small that homs, which are hack with a pale centre, and look exactly like the rudiment of the horns of the two preceding species. None of the females have any trace of the hons, and Mr. Saunders places in the same genns a species which has no horns in either sex (Elitphomia polita). It is of a shining blatk colour, and resembles Elaphomia cervicomis in form, size, and general appearance. The figmes above given represent these insects of their natural size and in charicteristic attitudes.

The natises seldom brought me muthing. They are poor creatures, and rarely shoot a bird, I ig, or kangaroo, or even the sluggish opossum-like Cuscus. The tree-kangaroos are found lecre, but must be very scarce, as my hunters, although out datly in the forest, never once saw them. Cockatoos, lories, and parroquets were really the only common birts. Even pigeons were saree, and in little varicty, although we occasionally got the fine crown pigeon, which was always welcome as an addition to our scantily furnished latder.

Just before the steamer arrived I had wonnded my ankle by clambering among the trunks and branches of falken trees (which formed my best hmang grounds for insects), and, as usual with foot womds in this climate, it tuened jnto au obstinate ulecr, kecping me in the house fur suberal dajs.

When it healed up it was followed by an internal inllamnation of the loot, which by the doctor's advice I poulticed ineessantly for four or five days, bringing out a severe inthaned swelling on the tendon above the heel. This had to the leeched, and lanced, and doctored with ointments and joultices for several weeks, till I was almost driven to duspail,- ior the weather was at length tine, and I was tantalized by secing grand butterflies flying past my door, and hinking of the iwenty or thirty new species of inseets that 1 ought to be getting every day. And this, too, in New Gumea !-a country which 1 might never visit again,-a comentry which no naturalist had ever resided in before,-a country which contained more strange and new and beantiful matural objects than any other part of the globe. The naturalist will be able to appreciate my feelings, sitting from morning to aight in my little hat, unable to nove without a cruteh, and ay only solace the birds my hunters brought in every atternoon, and the few insects caught by my Tenate man, Labagi, who now went out daily in my phace, hut who of course did not get a fourth part of what I should have obtained. To and to my trmbles all my men were more or less ill, some with bever, others wilh dysentery or agne; at one time there were three of them besides myself all belpless, the cook alone being well, and having enongh to to to wait upon us. The Prince of 'lidere and the Resideut of Banda were both in board the steamer, and were seeking Birds of Paradise, seuling men round in every direction, so that there was no chance of my getting even native skins of the rarer kinds; and any birds, insects, or animals the Dorey people had to sell were taken on boand the steamer, where purchasers were found for exerything, and where a larger variety of articles were offered in exchange than I had to show.

After anouth's close confinement in the louse I was at length able to go out a little, and about the same time I succeeled in getting a brat and six natives to take Ali and Lahayi to Amberbaki, aud to bring them back at the end of a month. Ali was charged to buy all the Birds of l'madise he could get, and to shoot and skin all other rare "r new hirds; and Lahayi was to cotlect insects, which I hopeal might be more abuadant than at Dorey. When I
 great change in the weighbournom, and one vers farmable to me. All the time I had heen laid up the ship's crew and the Jitranese snlijers who had heed herught in as tonder (a suling ship whech had arrived somatier the Etate, hat been employed cutting lown, sawiun, and splittiog lame trees for lisewool, to emathe the steamer to get back to Amboyn if the cond-ship did not return ; and they lad also clearel a number of wide, straight paths throurgh the finest in varionz directions, greatly to the astomishment of the natives, who could not nake out what it all mont, I had now a varicty of watks, and a rood deal of dead worl on which to searel for insects; hat notwithstanling threse mbantagne, they were not beady so phentilul an I hat formd tum at sariwak, or Ambmaa, or Datelian, confimming my opmon that lomey was not a goobl loculity: It is quite probalide, however, that at a siation a few miles in the interior, away frum the recently devated coralline rocks and the influmee of the seatar, anto nore ahandant harvest migh't be obtained.

Une aftemoon I went on farad the stemmer to return the caphan's visit, and was shown some reay niee sketehes (hy one of the linatemants), made on the somth coast, amp also at the Arfak momntain, to which they had mate an excursion. From these and thee eapona's description, it appeared that the prople of Arlak were similar to those of lorey, and I conht hor mothing of the stratishthatived race Which Lesson says inhabits the interior, but which no one has ever seen, and the aternmit of which I suspeet has originated in some mistake. The eaptain tudd me he hand monke at detaileal surver of part of the south const, and if the coal arrivel smand gataray at mace to Humbolut Bay, in lonnitude $141^{\circ}$ enst, whicls is the line up to which the buteh chan New Gumat On board the tender I fombl at hrother matumast, a Gemman matmel Iosenterge whas was dranghtsman to the surveying stadi. He hatd howsht two uen with hian to shont and skin livds, and had hera able to $\mathrm{l}^{\text {muchase }}$ a fow mare slins frob the matives. Among these wats a pair of the superb l'analise l'ae (Astrapia
 the intan! of Jende, wath haty le its Hative connay, as it
certainly is of the rarer species of crown pigeon (Goura steursii), one of which was brought alive and sold on boara Jobie, however, is a very dangerous place, and sailors are often murdered there when on shore; sometimes the vessels themselves being attacked. Wandammen, on the mainland opposite Jobic, where there are said to he plenty of birds, is even worse, and at either of these places my life would not have been worth a week's purclase had I ventured to live alone and unprotected as at Dorey. On board the steaner they had a pair of treekangaroos alive. They differ chiefly from the groundkangaroo in having a more hairy tail, not thickened at the base, and not used as a prop; and by the powerful claws on the fore-fect, by which they grasp the bark and branches, and seize the leaves on which they feed. They move along by short jumps on their hind-feet, which do not seem particularly well adapted for climbing trees. It 1as been supposed that these tree-kangaroos are a special adaptation to the swampy, hall-drowned forests of New Guinea, in place of the usual form of the group, which is adapted only to dry ground. Mr. Windsor Earl makes much of this theory, but, unfortunately for it, the treekangaroos are chiefly found in the northern peninsula of New Guinea, which is eutirely composed of hills and mountains with very little flat land, while the kangaroc of the low flat Aru Islands (Dorcopsis asiaticus) is a ground species. A more probable supposition seems to be, that the tree-kangaroo las been moditied to enable it to feed on folinge in the vast forests of New Guinea, as these form the great natural feature which distinguishes that country from Austraiia.

On June 5th, the coal-ship arrivel, having been sent back from Amboyna, with the addition of some fresh stores for the steamer. The woorl, which had been almost all taken on bonrd, was now unladen again, the coal taken in, and on the 17 th both steamer and tender left for Humboldt Pay. We were then a little quiet again, and got something to eat; for while the vessels were here every bit of fish or veretable was taken on board, and I had oftom to make a suall parroquet serve for two meals. Mly mea
now returned from Amberbaki, but, alas! brought me almost unthing. They had visited sereval villages, and even went two days' journey into the interior, but cond find no skins of Birds of l'aradise to purchase, except the common kind, and very few even of those. The birds found were the same as at Dorey, lout were still soares. None of the natives anywhere near the coast shoot or prepare Biads of I'aratise, which cone from far in the interior over two or three ranges of mountains, passing by barter from village to village till they reach the sea There the natives of Indey buy them, and on their return home sell them to the Buyis or Ternate traters, It is therefore hopeless for a traveller to go to any particular place on the coast of New Guine where rure Paradise hivels may have been lought, in hopes of obtaining fireshly killed specimens from the natives; and it also shows the scarcity of these birds in any one locality, since from the Amberbaki district, a celebrated phace, where at least five or six species have lecen procured, not oue of the raver ones las been obtaned this year. The I'rane of Thdore. who would errtainly have got them if any were to be had, was obliged to put up with a few of the common yellow ones. I think it probable that a lunger residence at Durey, a little farther in the interior, might show that several of the rarer kinds were tomol there, as I ohtuned a single female of the tine seale-breatsted Ptiloris magnificus. 1 was told at 'Ternate of a bird that is certainly mot yet known in Europe, a black King I aradise Bird, with the curleat tail and beatiful side phanes of the common species, but all the rest of the plumage glossy black. The people of Dorey knew nothing about this, atthunth they recognised by description most of the other species.

When the steamer left. I was sutfering from a severe attack of fever, In about a week I qot over this, lint it was followed by sucts a soreness of the whole inside of the mouth, tungue, ant gims, that for many days I conhel put, nothing solid betwen my lips but was obliged to subsist entirely on shaps, although in ohere fespets woy well. At the same time two of my men again foll ill, on wh theve, the other with lysentery, and buth sut vary lant. I did what 1 could fir dhew with my suall stork of ne licines,
but they lingered on for some weeks, till on June 26 th poor Jumat died. He was about eighteen years of ase, a native, I believe, of Bouton, and a quiet lad, not very active, but doing his work pretty steadily, and as well as he was ahle. As my men were all Mahometans, I let them hury him in their own fashion, riving them some new cotton cloth for a shroud.

On July Gth the steamer returned from the eastward. The weather was still terribly wet, when, according to rule it should have been fine and dry. We had scarcely noything to eat, and were all of us ill. Fevers, colds, sum dysentery were continually attacking us, and made me long to gret away from New Guinea, as much as ever I had longed to come there. The captain of the Ether paid me a visit, and qave me a very interesting account of his trip. They had stiyed at Humboldt Bay several days, and found it a much more beautiful and more interesting place than Dorey, as well as a better harbour. The natives were quite unsophisticaterl, being rarely visited except by stray whalers, and they were superior to the Dorey people, morally and physically. They went quite naked. Their houses were some in the water and some inland, and were all neatly and well built; their fielids were well cultivated, and the paths to them kept clear and open, in which respects Dorey is abominable. They were shy at first, and opposed the boats with hostile demonstrations, bemting their hows, and intimatiur that they would shoot if an attempt was made to land. Very judicionsly the captain gave way, but threw on shore a dew presents, and after two or three trials they were permitted to land, ant to go about and see the comntry, and were supplied with fruits and vegetables. All communication was carried on with them by signs-the Dorey interpreter, who accompanied the stemor, being unable to understand a word $0^{*}$ their languare. No new hirds or animals were oltained, but in their omaments the feathers of Paradise birds were seen, showing, as might be expected, that these birds muse for in this direction, and probably all over New Guinea.

It is curious that a rulimental love of art should co-exist with such a very low state of civilization The
people of Dorey ane great carvers and painters. The outsides of the houses, whereve there is a pauk are covered with rule yet charateristic thares. 'Ihe highpeaked prows of their boats are ornanented with masses of open filagree work, cut out of solid blocks of wood, and often of very tasteful design. As a figure-head, or pinnacle, there is oftem a human figure, with a head of eassowary feathers to imitate the l"apuan "mop." The flonts of their fishing-lines, the wooden beaters used in tempering the clay for their pottery, their tobaccoboxes, and other household artieles, are covered with carving of tasteful and olten elegant design. Did we not already know that such taste and skill are coms patille with utter barbarism, we could hardly believe that the same people are, in other matters, entirely wanting in all sense of order, comfort, or decency. Yet such is the case. They live in the most miserable, crazy, and filthy hovels, which are utterly destitute of anything that can be called fumiture; not a stool, or bench, or board is seen in them, no brush seems to be known, and the clothes they wear are often filthy bark, or rags, or sacking. Aloug the paths where they daily pass to and from their provision grounds, not an overhanging bough or straggling briar evar semas to be cat, so that you have to brush through a ram vegetation, creep under fallen trees and spiny creepers, and wade through pools of mud and mire, which cannot dry up because the sun is not allowed to penetrate. Their food is ahoost wholly roots and vegetables, with uish or game only as an oceasional luxury,
 and they are consequently very suliject to various skin diseases, the ehihen espectally being often niserable.

Lowking objects, blotcheal all oser with eruptions and sores. If these perphe are not satages, where shall we find any? Yet they have all a decided love fur the tine arts, and spend their leisure time in executing works whose good taste and elegance would often be admired in our schools of design !

During the latter part of my stay in New Gainea the weather was very wet, my only shouter was ill, and birds became scarce, so that my only resource was insect-linnting. I worked very hard every hour of fine weather, and daily obtained a number of new species. Every dead tree and fallen $\log$ was searched and searched again; and among the dry and rotting leaves, which still hung on certain trees which had been cut duwn, I found an abundent harvest of minute Coleoptera. Alhough I never afterwards found so many large and handsome beetles as in Borneo, yet I obtained here a great variety of species. For the first two or three weeks, while I was searching out the best localities, I took abont 30 different kimds of beetles a day, besides about lialf that number of buttertlies, and a few of the other orders. But afterwards, up to the very last week, I averagred 49 species a day. Un the 3 tat of May, 1 took 78 distinct sorts, a larger number than 1 had ever captured before, principally obtained among dead trees and under rotten bark. A good long walk on a fine day up the hill, and to the plantations of the natives, capturing everything not very common that came in my way, would produce about Gu species; but un the last day of June I brought hone no less than 9 a distinct kinds of beetles, a laraer mumber than I ever obtaned in oue day betore or since. It was a line hot day, and 1 devoled it to a search among dead letyes, beating loliage, and humbimg under rotten bark, in all the best stations I hat discovered during my walks. I was out from ten in the morning till three in the alternom, and it took mes six hous' work at home tor pir and set wat all the specimens, and to separate the species. Although I houl alreanly bern working this spot haily for two montls and a hailf, and had ohtained

3 Heteromera, 1 Elater, and 1 Buprestis. Even on the last day I went out, I obtained 16 new species; so that although I collected over a thousand distinct sorts of heetles in a space not much exceeding a square mile during the three months of my residence at Dorey, I camot believe that this represents one half the species really inhabiting the same spot, or a fourth of what might he obtained in an aren extending twenty miles in each direction.

On the 22d of July the schooner Hester Helena arrived, and five dives afterwards we bade adieu to Dorey, without, much regret, for in no place which I have visited have I encountered more privations and annoyances. Continual rain, continual sickness, little wholesome food, with a plague of ants and flies, surpassing anything I had before met with, required all a naturalist's ardour to enconnter ; atul when they were uncompensated by great success in collecting, became all the more insupportable. This long-thought-of and much-desired voyage to New Guisea hat realized none of my expectations. Instead of being far better than the Aru Islands, it was in almost everything much worse. Instead of producing several of the rater l'aradise binds, I had not even seen one of them, and had not obtained any one superlatively fine bird or insect. I cannot deny, however, that Dorey was verg rich in auts. One small black kind was excessively aloumant. Amost every shrub and tree was more or less inlested with it, and its large papery nests wore everywhere to be sebn. They immedrately took possession of my hates, huilding a harge nost in the rool, and forming papary innoels down amost every post. 'Ihey swamed on my table as I was at work seting out my insects, carrying them off from under my vory huse, and ewon tearing them from the cards on which they were grmmed if I leth them fire an instant. They crewhed continablly war my hathe and lace, got into my hatir, and roaned at will over my whale body, mot prolncins much inconvenionce till they heman to bite, whide they woult do an meeting with any nhotruction to hetir yassure, and with a shampess which made me jump acrain and rush to undress and turn nut the afiemer. They visited my bod also, so that night
 believe that during my three and a hatf monthes residenee at Dorey I was never for a sinde lour entirely free from them. They were not nearly so voraciuns ats many other kinds, but their numbers and mbiguty rembered it necessary to be constanty on guard against them.

The thes that troubled me most were a large kind of bhe-hotthe or blow-fly. Theses settled in swarms on my bird skins when lirst put out to dry, filling their phanage with masses of erges, which, it merglected, the next dity produced margots. They would aget under the wings or under the hedy where it rested on the dryinr-hoard, sometimes actually raising it up lualt an inch by the mass of ergs deposited in a few hours; and every eger was so firmly glued to the fibres of the feathers, as to make it a work of much time and patience to get them ofl' without injuring the bird. In no other locality have I ever been trouble ${ }^{\text {d }}$ with such a plague as this.

On the 29th we lett Dorey, and expected a quick voyage home, as it was the time of year when we ought to have had stemly sonthery and easterly winds. Iustead of these, however, we had calms and westerly breezes, and it was seventeen days before we reached Teruate, a distance of five hundred miles only, which, with average winds, could have been done in tive days. It was a great treat to mee to tind myself back anain in my comfortable house, enjoying milh to my tea and colfer, fresh bread and butter, and fowl and fish daily for clinner. This New Guinea voyine liad used us all up, and I determinal to stay and recruit before I commenced any frosh expeditions. My stacceding jouneys to (iilolo and Batchian have already leen narated, and it now only remains for me to sive an acount of my residence in Wisiou, the last Haphan territury I visited in search of Birds of Paradise.

## CHAPTER XXXV.

## voyage from ceram to waigiou.

(JUNE AND JULT 1860.)

IN my twenty-fifth chapter I have described my arrival at Wahai, on my way to Mysol and Waigiou, islands which belong to the Tapuan district, and the account of which naturally follows after that of my visit to the mainland of New Guinen. I now take up my narrative at my departure from Wahai, with the intention of carrying various necessary stores to my assistant, Mr. Allen, at Silinta, in Mysol, and then continuing my journey to Waigiou. It will be remembered that I was travelling in a small prau, which I had purchased and fitted up in Goram, and that, having been deserted by my crew on the const of Ceram, I had obtained four men at Wahai, who, with my Amboynese hunter, constituted my crew.

Between Ceram and Mysol there are sixty miles of open sea, and along this wide channel the east monsoon blows strongly; so that with native praus, which will not lay up to the wind, it requires some care in crossing. In order to give ourselves sufficient leeway, we sailed back from Wahai eastward, along the coast of Ceram, with the landbreeze; hut in the morning (June 18th) had not gone nearly so firr as I expected. My pitot, an old and experienced sailor, manel Gurulampoko, assured me there was a current setting to the eastward, and that we could easily Jay across to silintia, in Mysul. As we got ont from the land the wind inereated, ant there was a considerable sea, which mate my short lithe wessel plunge and roll alome violently. liy sumest we had not mot hallway acros, but could see Mysol distinctly. All night we went along uneasily, and at layneak, on looking wont anxionsly, I found that we had fallin melh to the west ward during the night, owing, no dould, to the pilot heines sleepy and not keeping: the boat sufficiently close to the wimi. We could see the

## LI.

mountaus distinctly, but it was clear we should not reach Silinta, and should have sonte difficulty in getting to the extreme westward point of the island. The sea was now very boisterous, and our prau was continually leaten to leeward by the waves, and after another weary day we found we could not get to Mysol at all, but night perhaps reach the island called Pulo Kanary, about ten miles to th'y nortl-west. Thence we might await a favourable wind to reach Waigamma, on the north side of the island, and visit Allen by means of a small boat.

About nine oclock at night, greatly to my satisfaction, we got under the lee of this island, into quite smooth water-for I had been very sick and uncomfurtable, and had eaten scarcely anything since the preceding morniug. We were slowly nearing the shore, which the smooth dark water tohd us we could safely approach, and were congratulating ourselves on soon being at anchor, with the prospect of hot coffee, a good supper, and a sound sleep, when the wind completely dropped, and we lad to get ont the oars to row. We were not more than two hundred yards from the shore, when I noticed that we seemed to get no nearer although the men were rowing hard, but drifted to the westward; and the prau would not obey the helm, but continually fell off, and gave us much trouble to bring her up again. Soon a loud ripple of water told us wo were seized by one of those treacherous currents which so frequently frustrate all the efforts of the voyager in these seas; the men threw down the oars in despair, and in a few minutes we drifted to leeward of the island fainfy out to sea again, and lost our last chance of ever reaching Mysol! Hoisting our jib, we lay to, and in the morning found ourselves only a few miles from the island, but with such a steady wind blowing from its direction as to render it impossible for us to get back to it,

We now made sail to the northward, hoping soon to get a more southerly wind. Towards noon the sea was much smoother, and with a S.S.E. wind we were layiug in the direction of Salwatty, which I hoped to reach, as I could there easily get a boat to take provisions and stores to my companion in Mysol. This wind did not, however, last long, but died away into a calm; and a light west wind

## L 12

springing up, with a dark bank of clouds, again gave us hopes of renching Mysol. We were soon, however, again disappointed. The E.S.E. wind began to blow again with violence, and contimed all night in irregular gusts, and with a short cross sea tossed us about unmercifully, and so continually took our sails aback, that we were at length forced to run before it with our jib ouly, to escape being swamped by our heavy mainsail. After another miserable and anxious night, we found that we had drifted westward of the island of Poppa, and the wind being again a little sontherly, we made all sail in order to reach it. This we did not succeed in doing, passing to the north-west, when the wind again blew hard from the E.S.E., and our last hope of finding a refuge till better weather was frustrated. This was a very serious matter to me, as I could not tell how Charles Allen might act, if, after waiting in vain for me, he should return to Wahai, and find that I had left there long before, and had not since been heard of. Such an event as our missing an island forty miles long would hardly oceur to him, and he would conclude either that our boat had foundered, or that my crew had murdered me and run away with her. However, as it was physically impossible now for me to reach him, the only thing to be done was to make the best of my way to Waigiou, and trust to our meeting some tinders, who might convey to him the news of my safety.

Finding on my map a group of three small islands, twenty-five miles north of Poppa, I resolved, if possible, to rest there a day or two. We could lay our boat's head N.E. by N.; but a heavy sea from the enstward so contimually beat us off our course, and we made so much lockay, that. I foumb it would be as much as we could do (i) reach them. It was a delicate point to keep our head in the hest direction, neither so close to the wind as to stop our way, or so free as to carry us too far to loeward. I continnally directed the steensman myself, and hy incessint vigilance succeeled, just at sumset, in brimging our boat to an anchor under the lee of the southem point of one of the ishuds. The anchomine was, however, by no means good, there being a fringins coral reef, dry at low water, beyond which, on a bottom strewn with masses of
coral，we were obliged to anchor．We had now been inces－ santly tossing about for four days in our small underked boat，with constant disappointments and anxiety，and it was a great comfort to lave a night of quiet and com－ parative safety．My old pilot had never left the helm for more than an hour at a time，when one of the others wound relieve him for a little sleep；so I determined the next morning to look out for a secure and convenient harbour， and rest on shore for a day．

In the morning，finding it would be necessary for us to get round a rocky point，I wauted my men to go on shote and cut jungle－rope，ly which to secure us from bring again drifted away，as the wind was directly off shore．I unfortunately，however，allowed myself to be overruled by the pilot and crew，who all declaved that it was the casiest thing possible，and that they would row the loat round the point in a few minutes．They accorlingly got up the anchor，set the jib，and began rowing；but，just as I had feared，we drifted rapidly oft shore，and had to drop anchor again in deeper water，and much farther ofl．The two lest men，a Papuan and a Malay，now swam on shore，each carrying a latchet，and went into the jungle to seck creepers for rope．After about an hour our anchor loosed hold，and began to drag．This alarmed me greatly，and we let go our spare anchor，and，by rumiser out all our cable， appeared tolerably secure again．We were now most anxious for the return of the men，and were going to fire our muskets to recall them，when we observed them on the beach，some way off，and almost immediately our anchors again slipped，and we drifted slowly away into deep water．We instantly seized the oars，but found we could not counteract the wind and current，and our frantic cries to the men were not heard till we had got a long way off，as they seemed to be hunting for shell－fish on the bead．Very soon，however，they stared at us，and in a few minutes seemed to comprehend their situation；for they rushed down into the water，as if to swim off，but again returned on shore，as if afraid to make the attempt． We had drawn up our anchors at first not to check our rowing；but now，finding we could do nothing，we let thom both hang down by the full leugh of the cables．This
stopped our way very much, and we drifted from shore very slowly, and hoped the men would hastily form a raft, or cut down a solt-wool tree, and paldle out to us, as we were still not more than a third of a mile from shore. They seemed, however, to have half lost their senses, grosticulating wildly to us, ruming along the beach, then ging into the forest; and just when we thought they had prepared some mode of making an attempt to reach ns, wo saw the smoke of a fire they had male to cook their shell-fish! They had evidently given up all idea of coming after us, and we were olliged to look to our own position.

We were now about a mile from shore, and midway between two of the islands, but we were slowly drifting out to sea to the westward, and our only chance of yet saving the men was to reach the opposite shore. We therefore set our jib and rowed hard; but the wind tuilent, and we drifted out so rapidly that we had some difficulty in reaching the extreme westerly point of the island. Our only saitor left, then swam ashore with a rope, and helped to tow us round the point into a tolerably safe and secure anchorage, well sheltered from the wind, but exposed to a little swell which jerked our anchor and made us rather uneasy. We were now in a sad plight, having lost our two hest men, and being doultful if we had strength left to loist our mainsail. We had only two days water on lwand, and the small, rocky, volcanic island did not promise us much chauce of finding any. The condnct of the men on shore was such as to render it doubtful if they would make any serious attempt to reach us, though they might easily do so, having two good choppers, with which in a day they could make a suall outwimer raft on which they could sately cross the two miles of smooth sea with the wind right aft, if they started from the cast end of the island, so as to allow for the curent. I could only hope they would be sensible enough to make the attenpt, and determined to stay as long as I could to give them the chance.

We passed manxious night, fearful of again breaking our anchor or rattan cable. In the morning (23d), finding all secure, I waded on shore wihh my two men, leaving the
old steersman and the cork on board, with a loaded musket to recall us if needed. We first walked along the leach, till stopped by the vertical clilis at the east end of the island, finding a place where meat had been smoked, a turtle-shell still greasy, and some cut wood, the leaves of which were still green,-showing that some boat had been here very recently. We then entered the jungle, cutting our way up to the top of the hill, but when we got there could see nothing, owing to the thickness of the forest. Feturning, we cut some bamboos, and sharpened them to dig for water in a low spot where some sudo-trees were growing; when, just as we were going to begin, Hoi, the Wahai man, called out to say he had found water. It was a deep hole among the sago-trees, in stiff' black clay, full of water, which was fresh, but smelt horrilly from the quantity of dead leaves and sago refuse that had fallen in. Hastily concluding that it was a spring, or that the water had filtered in, we baled it all out as well as a dozen or twenty buckets of mud and rubbish, loping by night to have a good supply of clean water. I then went on board to breakfast, leaving my two men to make a bamboo raft to carry us on shore and back without wading. I had scarcely finished when our cable broke, and we bumped against the roeks, Luckily it was smooth and calm, and no damage was done. We searched for and got up our anchor, and found that the cable had been cut by grating all night upon the coral. Had it given way in the night, we might have drifted out to sea without our anchor, or been setiously danaged. In the evening we went to fetch water from the well, when, greatly to our dismay, we found nothing but a little liquid mud at the bottom, and it then becaue evident that the hole was one whick had been made to collect rain water, and would never fill again as long as the present drought continued. As we did not know what we might sufier for want of water, we filled our jar with this mudly stuff so that it might settle. In the afternoon I crossed over to the other side of the island, and made a large fire, in order that our men might see we were still there.

The next day ( 24 th ) I determined to have another search for water; and when the tide was out rounded a
rocky point and went to the extremity of the island withont fimling any sign of the smallest stream. On our way back, noticing a very small dry led of a watercourse. I went up it to explore, although everything was so dry that my men loudly declared it was useless to expeet water there; but a little way up I was rewarded by finding a few pints in a small pool. We searched higher up in every hole and chamel where water marks appearel, hat could lind not a drop more. Sending one of my men for a large jar and teacup, we searehed along the beach till we found signs of another dry watercourse, and on ascending this were so fortunate as to diseover two deep sheltered rock-holes containing several gallons of water, enough to fill all our jars. When the cup came we enjoyed a good drink of the enol pure water, and before we left had carried away, I believe, every drop on the island.

In the evening a grod-sized prau appeared in sight, making apparently for the island where our men were left, and we had some hopes they might be seam and pieked up, but it passed along mid-chamuel, nad did not notice the sicmals we tried to make. I was now, however, pretty easy as to the fate of the men. There was plenty of sago on our rocky island, and there would probably be some on the that one they were left on. They had choppeers, and conld cut down a tree and make sago, and would most likely tind sufficient water ly digging. Shell-fish were athudant, and they would be able to manage very well till some boat should tonch there, or till I could send and fetch them. The next day we devotal to cutting wood, filling up our jars with all the water we could lind, and making ready to sail in the evening. I shot a small lory closely resembling a common species at Termate, and a glossy starling which differed from the allied liirds of Ceram and Matabello. Large wool-pigeons and crows were the only other birds I saw, but I did not obtain specimens.

About eisht in the evening of June 25 th we started, and found that with all hands at work we could just haul up our mainsail. We had a fair wind during the night and sailed north-east, finding ourselves in the morning about twenty miles west of the extremity of Waigiou with a
number of islands intervening, About ten o'clock we san full on to a coral reet, which alarmed us a good deal, but luckily got safe off again. About two in the afternoon wo reached an extensive coral reef, and were sailing close nlongside of it, when the wind suddenly dropped, and we drifted on to it betore we could get in our heavy mainsail, which we were obliged to let run dowa and fall partly overboard. We had much difficulty in getting off, but at last got into deep water again, though with reets and islands all around us. At night we did not know what to do, as no one on bourd could tell where we were or what dangers might surround us, the only one of our crew who was acquainted with the coast of Waigiou haviug benn left on the island. We therefore took in all sail and allowed ourselves to dritt, as we were some miles from the nearest land. A light breeze, however, sprang up, and about miknight we found ourselves again bumping over a conl reef. As it was very dark, and we knew nothing of our position, we could only guess how to get off arian, and had there been a little more wind we might have been knocked to pieces. However, in about half an hour we did get off; and then thought it best to anchor on the edge of the reef till morning. Soon after daylight on the 27 th, finding our prau had received no damage, we salled on with uncertain winds and squalls, threading our way among islands and reets, and guided only by a small map, which was very incorrect and quite useless, and by a general notion of the direction we ought to take. In the afternoon we found a tolerable anchorage under a small island and stayed for the night, and I shot a large fruitpigeon new to me, which I have since named Carpoplaga tumida. I also saw and shot at the rare white-headed kingfisher (Halcyon saurophaga), but did not kill it. The next morning we sailed on, and having a fair wind reached the shores of the large island of Waigion. On rounding a point we again ran full on to a coral reef with our mainsail up, but luekily the wind had almost died away, and with a good deal of exertion we managed to get safely ofi.

We now had to search for the narow chamel among the islands, which we knew was somewhere hereabouts,
and which leads to the villages on the south side of Waigina. Entering a deep lay which looked promising, we got to the end of it, but it was then dusk, so we nuchored for the night, and having just finished all our water could cook no rice for supper. Next morning early (2911) we went on shore among the mangroves, and a little way inland found some water, which relieved our anxiety considerably, and left us free to go along the coast in search of the opening, or of some one who could direct nis to it. During the three days we had now been among the reel's and islands, we had only seen a single small canoe, which had approached pretty near to us, and then, notwithstanding our signals, went of in another direction. The shores seemed all desert; not a house, or boat, or luman being, or a puff of smoke was to be seen ; and as we could only go on the course that the ever-changing wind would allow us (our lands being too few to row any distance), our prospects of getting to our destination seemed rather remote and precarious. Having gone to the eastward extrenity of the deep bay we lad entered, withont finding any sign of an opeuing, we turned westward; aud towards evening were so fortunate as to find a small village of seven miserable houses built on piles in the water. Luckily the Orang-kaya, or head man, could speak a little Malay, and informed us that the entrance to the strait was really in the bay we had examined, but that it was not to be seen except when close in-shore. He said the strait was often very narrow, and wound among lakes and rocks and islands, and that it would take two days to reach the large village of Muka, and three more to get to Waigiou. I stucceeded in hiring two men to go with us to Muka, bringing a small boat in which to return; but we had to wait a day for our guides, so I took my gun and made a little excursion into the forest. The day was wet and drizzly, and I only succeeded in shooting two small birds, but l saw the great black cockatoo, and had a glimpse of one or two Birds of Paradise, whose loud screams we had heard on first approaching the const.

Leaving the village the next morning (July 1st) with a light wind, it tow us all lay to reach the entrance to the chamel, which resembled a small river, aul was concealed
by a projecting point, so that it was no monder we did not disonver it amid the dense forest vegetation which everywhere covers these islands to the water's edge. A little way inside it becomes bounded by precipitous rocks, after winding among which for about two miles, we emerged into what seemed a lake, but which was in fact a deep gulf having a nartow entrance on the south coast. This gulf was studded along its shores witl numbers of rocky islets, mostly mushroom shaped, from the water having worn away the lower part of the soluble coralline linestone, leaving them overhanging from ten to twenty feet. Every islet was covereal with strange-looking shrubs and trees, and was generally crowned by lofty and elegant palms, which also studded the ridges of the mountainous shores, forming one of the most singular and picturesque landscapes I have ever seen. The current which had brought us through the narrow strait now ceased, and wa were obliged to row, which with our short and heavy prau was slow work. I went on shore several times, but the rocks were so precipitons, sharp, and honeycombed, that I found it impossible to get through the tangled thickets with which they were everywhere clothed. It took us three days to get to the entrance of the gulf, and then the wind was such as to prevent our going any further, and we might have had to wait for days or weeks, when, much to my surprise and gratification, a boat arrived from Muka with one of the head men, who had in some mysterious manner heard I was on my way, and had come to my assistance, bringing a present of cocoa-nuts and vegetables. Being thoroughly acquainted with the coast, and having several extra men to assist us, he managed to get the prau along by rowing, poliug, or sailing, and by night had brought us safely into harbour, a great relief after our tedious and unhappy voyage. We had been already eight days among the reefs and islands of Waigiou, coming a distance of about fifty miles, and it was just forty days since we had sailed from Goram.

Immediately on our arrival at Muka, I engaged a smail boat and three natives to go in search of my lost men, and sent one of my own men with them to make sure of their going to the right island. In ten days they returned, but
to my grent regret and disappointment, without the men. The weather lad leen very had, and though they had reacheal an island within sight of that in which the men were, they could set no further. They lad waited there six days for better weather, and then, having no more provisions, ant the man I hat sent with them being very ill and not expected to live, they returned. As they now knew the island, I was detemined they slonld make anotlee trial, and (lyy a liboral mayment of knives, handkerchiefs, and tohaceo, with plenty of provisions) persuaded them to start hack immediately, and make another attempt. They did not return again till the 29th of July, having stayed a few days at their own village of Bessir on the Way; but this time they had succeded and brought with them my two lost men, in tolerable health, though thin and weak. They had lived exactly a month on the island; had found water, and had subsisted on the ronts and tender flower-stalks of a species of Bromelia, on shell-fish, and on a few turtles eorgs. Havior swum to the island, they had only a pair of trousers and a shint between them, but had made at hut of palm-leaves, and had altogether got on very well. They saw that I waited for them thee days at the opposite island, but had been afraid to cross, lest the current should have carried them out to sea, when they would have been inevitably lost. They had felt sure I would send for them on the lirst opportunity, and appeared more mateful than natives usually are for my having done so; while I felt much relieved that my voyage, though sufliciently unfortumate, had not involved loss of life.

## CHAPTER XXXVI.

## Waigiou,

(JULY TO Betmamber 1860.)

THE village of Muka, on the south coast of Waigiou, consists of a number of poor huts, partly in the water and partly on shore, and scattered irregularly over a space
of about half a mile in a shallow bay, Around it are a few cultivated patches, and a grood deal of second-growth woody vegetation; while behind, at the distance of about half a mile, rises the virgin forest, through which are a few paths to some houses and plantations a mile or two inland. The country round is rather lat, and in places swampy, and there are one or two small streams which run belind the village into the sea below it. Finding that no house could be had suitable to my purpose, and having so often experienced the advantages of living close to or just within the forest, I olitained the assistance of haif-adozen men; and having selected a spot neat the path and the strean, and close to a fine fig-tree, which stood just within the forest, we cleared the ground and get to building a house. As I did not expect to stay here so long as I had done at Dorey, I built a long, low, narrow shed, about seven feet high on one side and four on the other, which required but little wood, and was put up very rapidly. Our sails, with a few old attaps from a deserted hut in the village, formed the walls, and a quantity of "cadjans," or palm-leaf mats, covered in the roof. On the third day my house was finished, and all my things pat in and comfortably arranged to begin work, and I was quite pleased at having got established so quickly and in such a nice situation.

It had been so far fine weather, but in the night it rained hard, and we found our mat roof would not keep out water. It first began to drop, and then to stream over everything. I had to get up in the middle of the night to secure duy insect-boxes, rice, and other perishable articles, and to find a dry place to sleep in, for my bed was soaked. Fresh leaks kept forming as the rain continued, and we all passed a very mismable andi slecpless mioht. In the morning the sun shone highty, and everything was pat out to dry. We triod to tind out why the mats leaked, and thought we had disenvered that they hat bera lam on npide elown. Waving shifted thom anl, and got creryhing dry and confortable hy the eronimg, we aquin went to boil. and before midnight wore agsin awaked ly torrents of raiu and leaks streaning in unen us as hal as evor. Thare was 110 wore sleep for the that night, and the next
day our ronf was again taken to pieces, and we came to the conclusion that the fault was a want of slope enourh in the roof for mats, although it would be sufficient for the usual uttap thatch. I therefore purchased a few new and some old attaps, and in the parts these would not cover we put the mats double, and then at last had the satisfaction of finding our roof tolerably water-tight.

I was now able to begin working at the natural history of the island. When I tirst arrived I was surprised at being told that there were no Paradise Birds at Muka, although there were plenty at Bessir, a place where the natives canght them and prepared the shins. I assured the people I had heard the cry of these lirals close to the village, but they would not belicve that I could know their cry. However, the very first time I went into the forest I not only heard but saw them, and was convinced there were plenty about; but they were very shy, and it was some time before we got any. My hunter first shot a female, and I one day got very close to a fine male. He was, as I expected, the rare red species, Paradisea rubra, which alone imhabits this island, and is found nowhere else. He was quite low down, running along a bough searching for iusects, almost like a woodpecker, and the long black riband-like filaments in his tail lung down in the most graceful double curve imaginable. I covered him with my gun, and was going to use the barrel which had a very small charge of powder aud number eight shot, so as not to injure his plumage, but the gan missed fire, and he was off in an instant among the thickest jungle. Another day we saw no less than eight fine males at different times, and fired four times at them; but though other lirds at the same distance almost always dropped, these all got away, aud I began to think we were not to get this magnificent species. At length the fruit ripened on the fig-tree close by my house, and many birds came to feed on it; and one morning, as I was taking my coflce, a male Paradise Bind was scen to settle on its top, I seized my gun, ran under the tree, aud, gazing up, could see it flying across from branch to branch, seizing a fruit here and another there, and then, hefore I could get a sufficient aim to shoot at such a height (for it was one of

the loftiest trees of the tropics), it was away into the forest. They now visited the tree every moming; but they stayed so short a time, their motions were so rapid, and it was so dilticult to see them, owing to the lower trees, which impeded the yiew, that it was only after several days watching, and one of two misess, that 1 bronght down my hini-a male in the lume sury nificent $I^{\text {hanamge. }}$

This bird differs very molh from the two large species which I had alrealy obtained, and, although it wants the grace imparted by their long golden trains, is in many respects more remarkable and more beautiful. The head, back, and shoulders are clothed with a richer yellow, the deep metallic green colour of the throat extenuls further over the head, and the feathers are elongated on the forehead into two little erectile crests. The side plumes are slorter, but ave of a rich red colour, terminating in delicate white points, and the middle tail-feathers are represented by two long rigid glossy ribands, which are black, thin, and semicylindrical, and droop gracefully in a spiral curve. Several rother interesting lirds were oltained, and about half-adozen quite new ones; but none of any remarkable beanty, escept the lovely little dove, P tilonopus pulchellus, which with several other pigeons I shot on the same fig-tree close to my house. It is of a beatiful green colour above, with a forehead of the richest crimson, while beneath it is ashy white and rich yellow, banded with violet red.

On the evening of our arrival at Muka I observed what appeared like a display of Aurora Borealis, though I could hardly believe that this was possible at a point a little south of the equator. The night, was clear and calm, and the northern sky presented a diflused light, with a constant stecession of faint vertical flashings or tlickerings, exactly similar to an ordinary aurora in England. The next day was fine, but after that the weather was unprecedentedly bad, considering that it ought to have been the dry monsoon. For near a month we lad wet weather; the sun either not appenring at all, or only for an hour or two about noon. Morning and evening, as well as nearly all night, it rained or drizzled, and hoisterous winds, with dark rlomeds, fomen the daily programme. With the exception that it was nover cold, it wats just such weather as a very bad English Noveminer or Febrwary.

The pemple of Wajesins are not truly indisenes of the island, which f"rstesis no "Alturos," or aborginal inlobitants. Tlluy alluar to be a mixed race, party from Gilnd, partly fron Now Guinea. Malays and Alfuros from the fimmer ishad have probalily sattled here, and many of thom have taken l'upuau wives lrom Salwatty or

Dorey, while the influx of people from those places, and of slaves, has led to the formation of a tribe exhibiting almost all the transitions from a nearly pure Malayan to an entirely lapuan type. The lauguage spoken by them is entirely lapuan, being that which is used on all the coasts of Mysol, Salwatty, the north-west of New Guisea, and the jslands in the preat Geelvink Bay,-a fact which indicates the way in which the const settlements lave becu formed. The fact that so many of the islands betwen New Guneat and the Molnceas-stush as Waigion, Guent, Poppa, Obi, Batchian, as well as the south and east peuinsulas of Gilolo-possess no aborigimal tribes, but are inhabited by people who are evifenty mongrels and wanderers, is a remarkable corroborative proof of the distinctness of the Malayan and Papuan races, and the separation of the geographical areas they inhahit. -If these two great races were direct modifications, the one of the other, we should expect to find in the intervening region some homgrencous indigenons race presenting intermediate characters. For example, hetween the whitest inhabitants of Europe and the black Klings of South India, there are in the intervening districts homogencous races which form a gradual transition from one to the other; while in America, although there is a perfect trausition from the Anglo Saxon to the negro, and from the Spaniard to the Indian, there is no homogeneols race forming a natural transition from one to the other. In the Malay Archipelago we have an excellent example of two absolutely distinct races, which appear to have approached each other, and intermingled in an unoceupied territory at a very recent cooch in the history of man; and I feel satistied that no unprejudiced person could study them on the spot without beins convinced that this is the true solution of the problem, rather than the ahost universally aceepted view that they are but modifications of one and the same race.
The prople of Muka live in that alyject state of poverty that is almost inways found where the sazo-tree is abundant. Very few of them take the trouble to plant any vegetables or fruit, lat live almost entirely on sago and fish, sclline a lithe tripang or tortoiseshell to hoy the ecanty clothing they requre. Ahoost all of them, how-
ever, possess one or more lapuan shaves, on whose latum they live in almost absolute idleness, just going out on little fishing or trading excursions, as an excitment in their monotomous existence. They are under the rule of the Sultan of Tidore, amd every year have to fay in small tribute of Iaradise birals, tortoiseshell, or sago. To whain these, they fo in the fine season on a trading vovage to the mandand of New Guinea, and gething a fow ghonls on credit from some Cown or Bugis tauler, make hamd bargains with the matives, and grin enoush to pay their ribute, and leave a little prolit for thenselves.
Such a country is not a very pleasant one ta live in, for as there are no superlhities, there is nothing to sell; ; thd had it not heen for a tader from Ceram who was residing there during my stay, who bat a suall vegetable garlen, and whose men oceasionally got a few spare fish, I should often have had nothing to eat. Fowls, fruit, aud vegetables are luxuries very ruty to be parchased at Muka; and even cocon-nuts, so indispensable for eastern coukery, are not to be obtainel, for though there are some hundrels of trees in the village, all the fruit is eaten green, to supply the place of the vegetahles the peoph. are too lazy to cultivate. Without eggs, cocor-muts, or plantains, we had very short comnons, and the boisterons weather being unpropitions for fishing, we hat to live on what few eatable hirds we could shont, with an ocuasional cuscus, or castern opossum, the only quadruped, except pigs, inhabiting the island.

I had only slout two male Paraliseas on my tree when they ceased visiting it, cither owing to the fruit becoming scarce, or that they were wise enongh to know there wats danger. We continned to liear and see them in the forest, but after a month had not :ntuceeded in shooting any more; and as my chief object in visiting Waigion was to get these Tirids, I determined to go to lessir, where there are a number of Papuans whe eatch anl preserve them. I hired a small outrisger boat for this juurney, and left one of my nuen to guard my honse and grods. We had to wait several days for fine weather, and at length started early one morning, and arrived late at night, atter a rough aud disagreeable passage. The village of Bessir was built in
the water at the point of a small island. The chief fool of the prople was evidently shell-tish, since great luaps of the shells had accumulated in the stallow water betwen the houses and the land, forming a regular " kitchen-mid den" for the exploration of snme thture archrologist. We spent the night in the chief's house, and the wext moming went over to the mainand to look out for a place where I could reside. This part of Waigion is really another island to the south of the narrow clannel we hat passed through in coming to Muka. It appears to consist almost entirely of raised coral, whereas the northern island contains hard crystalline rocks. The shores were a range of low limestone cliffs, wom not by the water, so that the upper part generally overhung. At distant intervals were little coves and openings, where small streams came down from the interior' ; and in one of these we landed, pulling our boat up on a patch of white samly beach. Immediately above was a large newly-made plantation of yams and plantains, and a small hut, which the chief said we might have the use of, if it would do for he. It was quite a dwarf's house, just eight feet square, raised on posts so that the floor was four and a half feet above the ground, and the highest part of the ridge only five feet above the floor. As I am six feet and an inch in my stockings, I looked at this with some dismay; but finding that the other houses were much further from water, were dreatfully dirty, and were crowden with people, I at once accepted the little one, and determined to make the best of it. At first I thought of taking out the floor, which would leave it high enough to walk in and out without stooping ; but then there would not be room enough, so I left it just as it was, had it thorouglily chaned out, and brought up my baggige. The upper story I used for sleeping in, and for a store-room. In the lower part (which was quite open all round) I fixed up a small table, arranged my boxes, put up hanging-sholves, laid a mat on the ground with my wicker-chair upon it, hung up another mat on the windward side, and then found that, by bendims double and carefully creeping in, I could sit on my clair with my head just clear of the ceiling. Here I lived pretty comfortably for six weeks, taking all my menls and dung all my work at my littie
table, to and from which 1 hat to creep in at semi-Lusizontal pusition a dozen times a day; and, atter a lew severe knosk on the head by sudtenty risins from 1 ay chair, learnt to accomanalate inyself to cirenmstances. We put up a litte slopius cooking-hut outside, and a bench on which my lirds comhl skin theit hirds. At nisht I went up, to my little loft, they spean their mats ma the flow betow, and we none of us grumbed at our lodgings.

My first business was to send for the men who were accustomcal to catch the Jirds of Pambise. Several canc, and I showed them my hatchets, beads, knives, and handkerchiefs; and explained to them, as well as I could by sigus, the price I wouk give for fiesh-killed specimens. It is the universal enstom to pay thm everything in atyance; but only one man ventured on this cecasion to fake goods to the value of two himes. The rest were suspirgious, and wanted to see the result of the first batenin with the strange white man, the only wne who hato arer conte to their ishand. After there days, my man lrourht me the first bird-a very liue spectmon, and alive, but tied up in a
small bag, and consequently its tail aud wing feathers very tumeh ernshed and injured. I trieal to explain ta him, aud to the others that came with him, that I wanted then as perfeet as possible, and that they should either kill them, or kerep them on a perel with a string to their ler. As thry were now appremtly satisfied that all was fair, and thit I had no ulterior designs upon them, six others took away gools; some thr one liorl, some for more, and one for as many as six. They said they had to go a long way for them, am that they would come back as soon as they caught any. At intervals of a few lays or a week, some of then would return, bringing me one or more hirds; but thongh they did not bring any more in hase, there was not mud improvement in their condition. As they caught them a long way off in the forest, they would scarcely ever come with one, liut would tie it by the $\log$ to a stick, and put it in their house till they caught another. The poor creature would make violent efforts to cesape, would get among the ashes, or hang snspeuded by the leg till the limb was swollen and half-putrofiea, and sometimes die of starvation and wory. One had its beantiful heal atl defiled by pitch from a dammar torch; another hat heen so long dead that its stomach was turning green. Luckily, however, the skin and plumage of these hime is so firm and strong, that they bear washing and cleaning hetter than alnost any other sort; and I was generalty able to clean them sa well that they did not perepptibly differ from those I had shot myself.

Some few were brought me the sume day they were caught, and I hal an opportunity of examining them in all their beauty and vivacity. As soon as I found they were generally brought alive, I set one of my men to make a large bantuo cage with troughs for food and water, hoping to be able (1) keep some of them. I got the natives to bring me branches of a fruit they were very fond of, and I was pleased to lind they ate it greedily, and would also take any number of live gratshoppers $I$ gave them, strip inig off the legs and wings, and then swallowing then. They drank plenty of water, and were in constant motion, jumping alout the cage from perch to pereh, clinging on the top and sides, and rately
resting a moment the first day till nirhtfall. The secom thay they were always less active, although they would eat as freely as hefore; and on the morning of the third day they were almost always found dead at the bottom of the cage, without any apparent cause. Some of them ate boiled rice as well as fruit and insects; hat after trying many in succession, not one out of ten livel more than three days. The seconl or thind day they would be dull, and in several cases they were seized with convuisions, and fell off the perels, dying a lew hours atierwards. I tried immature as well as full-phonagel biris, but with no better success, and at length gave it up as a hopeless task, and confined my attention to preserving specimens in as good a conlition as possible.

The Red birds of Paradise are not slout with llunt arrows, as in the Aru Islamls and some parts of New Guinea, but are snarel in a very ingenions maner. A large climbing Arum lears a rell reticulated fruit, of which the birds are very fond. The hunters fasten this fruit on a stout forked stick, and provide themselves with a fine but strong cord. They then seek out solne tree in the forest on which these hirds are accustomed to perch, and climbing up it fasten the stick to a brach and armuge the cord in a noose so ingenionsly, that when the bird comes to eat the fruit its legs are canght, anl by pulling the end of the cord, which hangs down to the gromid, it comes free from the branch and brings down the bird. Sometimes, when food is abundat elsewhere, the honter sits from zuming till night umber his tree with the cord in his band, and even for two or three whole days in succession, without even getting a bite; while, on the other land, if very lucky, he may get two or three birds in a day. There are only eight or ten men at Bessir who practise this art, which is unknown anywhere else in the island. I determined, therefore, to stay as long as possithe, as my only chance of getting a good series of specimens; and although I was nearly starved, everything eatable by civilized man being scarce or altoge ther absent, I fiwally succeeded.

The vegetables and fruit in the plantations around us did not sulfice for the wants of the inhahitants, and were almost always dig up or gatherel before they were ripe. It
was very rarely we could purchase a little fish; fowls there were none; and we were reduced to live upon tongh pireons and cockatoos, with our rice and sagr, and sometimes we could unt get these. Having beeu already eight months on this woynge, my stack ni all coudiments, spices and butter, was exhasted, and I fomo it impossible to eat sutheient of my tasteless and unpalatable food to support heath. I got very thin and weak, and had a cutions disease known (I have since hemd) as bow-ague. Directly after beakiast every moming an intense pain set in on a small spot on the right temple. It wis a severe burning ache, as lat as the worst toothache, and lastend about iwo hours, grenerally going off at noon. When this fimally ceased, I hat an attuck of fever, which left me so weak amb so mahle to eat our regular food, that Ifeel sure my life was saved by a couple of tins of soup which I hand long reserved for some such extremity. I used often to go out searching alter veretables, and found a great treasure in a lot of tomato plants run wild, and bearing little fruits abont the size of gooseberries. I also boiled up the tops of pumpkin plants and of ferns, by way of greens, and oecasionally got a few green papaws. The natives, when hard up for food, live uon a flesly seaweed, which they boil till it is tender. I tried this also, lat fonnd it too salt and bitter to be endured.

Towards the end of September it beame absolntely necessary for me to return, in order to make our homeward voyage before the end of the east monsoon. Nost of the men who had taken payment from me had brought the birts they had agreed for. One poor fellow had heen so unfortunte as not to get one, and he very honestly brought hack the axe he had received in anvanop; another, who had arreel for six, bronght we the fifth two days before I was to start, and went ofl immediately to the forest again to get the other. IIe did not return, however, and we loaded our boat, and were just on the point of starting, when he came runing down after ns holding up a bind, which he handed to me, satyins with great satisfaction, "Now I owe you nothinus." These were remarkable and quite moxpected instances of honesty amoug simages, where it would have been very ensy fur
them to have been dishonest without fear of detection or punishment.

The comntry round about Bessir was very hilly and rugged, bristling with jagged and honey-conbed corabline rocks, and with curious little chasus and ravines. The paths often passed through these rocky clefts, which in the depths of the forest were gloomy and dark in the extreme, and often full of tine-leaved herbaceuns plants and curions blue-foliaged Lyeopodiacee. It was in such places as these that I oltained many of my most beantiful small butterfies, such as Sospita statira and Taxila pulchra, the gorgeons blue Amblypodia hereules, and many others. On the skirts of the plantations I found the hanclsome lilue Deudorix despena, and in the shady wools the lovely Lycaua wallicci. Here, too, I obtained the beautiful Thyca aruna, of the richest orange on the upper side, while below it is intense crimson and glossy black; and a superb specimen of a green Ornithoptera, absolutely fresh and perfect, and which still remains one of the glories of my cabinet.

My collection of birds, thongh not very rich in number of species, was yet very interesting. I got another specimen of the rare New Guinea kite (Henicopernis longicauda), a large new goatsucker (lodargus superciliaris), and a most carious ground-pigeon of an entirely new genus, and remarkable for its long and powertul bill. It has heen mamed Henicophaps allitions. I was also much pleased to obtain a fine series of a large fruit-pigeon with a protuberance on the hill (Carpophaga tumida), and to ascertain that this was not, as had been liitherto supposed, a sexual character, but was found equally in male and female birds. I collected only seventy-three species of hirts in Waigion, but twelve of them were entirely new, and many others very rare; and as I brought away with me twenty-four fine specimens of the laradisen rubra, I did not regret my visit to the island, although it had by no means answered my oxpectations.

## CHADTER XXXVII.

## VOV'AGE FROM WAMGOU TO TEHNATE.

(SEFTEMBER 29 TO NOYEMBER 5,1860 .)

IHAD left the old pilot at Waigion to take care of my house and to get the prau into sailing onder-to cauls her bottom, and to look atter the upper works, thateh, and rigging. When I returned I found it nearly reads, and immediately began racking up and preparing for the voyage. Our mainsail had formed one site of our house, but the spanker and jib liad been put away in the roof, and on opening them to see if any repairs were wanted, to our horror we found that sone rats had made them their nest, and had guawed through them in twenty places. We had therefore to buy matting and make new sails, and this delayed us till the 200 of September, when we at length left Waigion.

It took us four days before we could get clear of the land, having to pass along narrow straits beset with reefs and shoals, and full of strong emrents, so that an unfavourable wind stopped us altogether. One day, when nearly clear, a contrary tide and head wind drove us ten miles back to our anchorage of the night befores This delay made us atraid of ruming short of water il we should be becalmed at sea, and we therefore determined, if possible, to touch at the island where our men had been lost, and which lay directly in our proper course. The wind was, however, as usual, contrary being S.S.W. iustead of S.S.E., as it should have been at this time of the year, and all we could do was to reaph the ishand of Gagie, where we came to an anchor by moonlight under bare volcanic hills. In the morning we tried to enter a deep bay, at the head of which some Galela fishermen told us there was water, but a head-wind prevented as. For the reward of a hamkerchief, however, they took us to the place in their boat, and we filled up our fars and hambons. We then went round to their cauping-place on the norn

coast of the island to try and buy something to eat, but could only get smoked turtle meat as black and at hard ns lumps of coal. A little further on there was a plantation belonging to chuele people, but under the eare of a Papuan slave, and the next morning we got some plautains and a few vegetables in exchate for a hadkerchief and some kuives. On leaving this place our anchor hat got foul in some rock or sunken log in very deep water, and after many unsuccessful attempts, we were foreed to cut our rattan cable and leave it behind us. We had now only one anchor left.

Starting early, on the the of October, the same S.S.W. wind continut, and wo began to fear that we should hardy clear the southern point of Gilolo. The night of the fth was squally, with thunder, but atter miluight it got tolerably fair, and we were going along with a light wind and looking out for the coast of (iilolo, which we thought we must be nearing, when we heard a dull roaring sound, like a heavy surf, bechind us. In a short time the roar increasen, and we saw a white line of foam coming on, which rapidly passed us without doing any ham, ats onr boat rose easily over the wave. At short intervals, ten or a dozen others overtook us with great rapidity, and then the seat became perfectly smooth, as it was before. I concluded at once that these must be earthquake waves; and on referenee to the old voyagers we find that these seas have been long subject to similar phenumena. Dampier encountered them near Mysol and New Guinea, and describes them at follows: "We found here very strange tides, that ran in streams, making a great sea, and roaring so loud that we could hear them before they came within a mile of us. The sea round about them seemed all broken, and tossed the ship so that she would not auswer her helm. These ripplings commonly lasted ten or twelve minutes, ame then the sea beeame as still and strootly as a millpond. We sounded often when in the midst of them, but found no ground, neither could we perceive that they drove us any way. We had in one night several of these tides, that came mostly from the west, and the wind being from that quater we commonly heard them a long time before they came, and sometimes lowered our topsails, thinking it was
a gust of wind. They were of great length, from morth io snath, hat their breadh not exereding 200 yards, aud they drove a great pace. lor though we had little wind to muve us, yet these woud soon pass away, and leave the water very smooth, and just before we coconntered them we met a great swell, but it diel not brak." some time afterwards, I learat that an earlhyake hau been felt on the coast of (iilolo the very day we had encountered these curious waves.

When daylight came, we saw the lam of Gilolo a few miles off, but the point was unfortunately a little to windwand of us. We tried to lomee up all we could to romul it, hut as we apmoached the shore we what into a strong current sutting northward, which carried us so rapidly with it that we found it necessary to stand oll again, in onder to get out of its influences. Sometmes we alproached the point a little, and our hopes rewived; then thow wind fell, and we drifted slowly away. Night found us in nearly the same position as we had occupied in the moming, so we hung down our anchor with about filteen fathoms of cable to prevent drifting. On the muming of the 7th we were however, a grood way up the const, and we now thought our only clance would be to get close in-slore, where there might he a return current, and we could then row. The prau was heavy, and my men very poor creatures for work, so that it took us six hours to get to the elfge of the reef that fringed the shore; and as the wind might at any moment how on to it, our situation was a very dangerous one. Luckily, a short distance ofl there was an sumly bay, where a small stream stopped the growth of the coral ; and by evening we reached this and anchored for the night. Here we found some Galela men shooting decr and pigs; but they coulil not or would mot speak Malay, and we could get lithe information from them. We found out that along slome the cument changed with the tide, while about a mile ont it was always one way, and against us; aml this gave us some hopes of getting lack to the point, from which we were now distant twenty miles. Next moming we foum that the Galela men had lelt betore daylight, having perbaps some vague fear of our intentions, and very likely taking me for a pirate. During the morning a boat
passed, and the peophe informert us that, at a short distande forther towards the point, there was a much better larbour, where there were plenty of Galela men, from whom we might probably get some assistance.

At three in the afternom, when the enment tumed, we started; but having a head-wind, made slow prosress. At dusk we reached the entrance of the harbour, but an chly and a gust of wind carried us away and out to sea, Atter sunset there was a land breeze, and we sailed a little to the south-east. It then became calm, and we humg down our anchor forty fathoms, to endeavour to counteract the current; but it was of little avail, and in the morning we fombl ourselves a good way from shore, and just opposite our anchorage of the day before, which we aratin reached by hard rowing 1 gave the men this day to mest and sleep; and the next day (Oct. 10th) we again started at two in the moming with a land breeze. After I had set them to their oars, and given instructions to keep close iu-shore, and on no accuunt to get out to sea, I went below, being rather unwell. At daybreak I found, to my great astonishment, that we were again far off-shore, and was told that the wind had gradually turned more ahead, and had carried us out-none of them having the sense to take down the sail and row in-shore, or to call me. As soon as it was daylight, we saw that we had drifted back, and were again opposite our former anchorage, and, for the third time, had to row harl to get to it. As we approached the shore, I saw that the current was favourable to us, and we continued down the const till we were close to the entrance to the lower harbour. Just as we were congratulatiug ourselves on having at last reached it, a stroug south-east squall came on, blowing us back, and rendering it impossible for us to enter. Not liking the idea of again returnjugr, I determined on trying to anchor, and succeeded in loing so, in very decp water and close to the reefs; but the Irevailing winds were such that, should we not hold, we shond have no difficulty in getting out to sea. By the time the squall hatd passed, the current had turned ngainst us, and we expected to have to wait till foul int thu afternoun, when we intended to enter the harbour.

Now, however, came the clinas of our troubles. The swell prouluced by the squall made us jerk our cable a grood deal, and it suddenly snapped low down in the water. We drifted out to sea, and immerliately set our mainsail, but we were now without any auchor, and in a vessel so poorly manned that it could not le rowed aqainst the most feeble current or the slightest wind, it would be madness to approach these dangerous shores except in the most perfect ralm. We had also only three days' food left. It was therefore out of the question making any further attempts to get roum the point without assistance, and I at once determined to mon to the village of Gani-diluar, about ten miles turther north, where we understood there was a good harbour, and where we might get provisious and a fuw more rowers. Hitherto winds and currents had invariably phosed om passage southward and we might have expected them to be favourahle to us now we had turned our howsprit in an opposite direction. But it imnediately tell calm, and then after a time a westerly land breeze set in, which would not serve us, and we had to row again for hours, and when night came had not reached the village. We were so fortunate, however, as to find a deep sheltered cove where the water was quite smooth, and we constructed a temporary anchor by filling a sack with stones from our ballast, which being well secured by a network of rattans held us safely during the night, The next morning my men went on shore to cut wood suitable tor making fresh anchors, and about noon, the current turning in our lavour, we proceeded to the village, where we found an excellent and well-protected anchorage.

On inquiry, we fomm that the head men resided at the other Gani on the western side of the peninsula, and it was necessary to semb messengers across (about half a day's journey) to inform them of my mrival, and to beg them to assist me. I then succeeded in buying a little sago, some dried deer-meat and cocon-nuts, which at once reliever our immediate want of sourehing to cat. At night we found our bag of stones still held us rery well, and we slept tranquilly.

The next day (Octoher 12th), my men set to work making anchors and oars. The native Malay anchor is
ingeniously constructed of a piece of tourl forked timburt; the Huke beiug strengthened by iwisted rattans Linding it to the stent, while the cross-piece is formed of a lomy flat stone, seemred in the same manner. These anchors, when well made, hold exceedingly tim, and, owing to the experise of iron, are still almost muiversally used on board the sunaller prans. In the aftemown the head men arived, and promised me as many rowers as I could put on the prau, and also lought me a few egrs and a little rice, which were very acopptable. On the 1 thth there was anorth wind all day, which would have been invalnable to us a few days earlier, but which was now only tantalizing. On the 16th, all being renty,

3AMAM ANETLOAR
we started at daybreak with two new anchors and ten rowers, who understood their work. By evening we had come more than half-way to the point, and anchored for the night in a small bay. At three the next morming I ordered the anchor up, but the rattan eable parted close to the botiom, having been chalded by rocks, and we then lost our third anchor on this unfortunate voyage. The day was calm, and by noon we passed the southern point of Gilolo, which had delayed us eleven days, whereas the whole soyage during this monsoon should not have occupied more than hall that time. Having got round the point our course was exactly in the opposite direction to what it had been, and now, as usual, the wind changed accordingly, coming from the northand north-west,-so that we still had to row overy mile up to the village of Gani, which we did not reach till the evening of the 18th. A Bugis trader who
was residing there, and the Senaji, or chicf, were very kind; the former assisting me with a spare anchor and at ratle, and making me a present of some vegretables, and the latter baking tresh sago cakes for my men, and giving me a couple of fowls, a loottle of oil, and some puapkins. As the weather was still bery uncertain, I fot four extra men to accompany me to Ternate, for which place we started on the aiternoon of the 20th.

We had to keep rowing all night, the laud breezes being too weak to enable us to sail against the current. During the altemoon of the elst we had an lome's fair wind, which soon changed into a heavy squall with rain, and my clumsy men let the mainsail get taken abnek and nearly unset us, tearing the sail, and, whit was worse, losing ant hour's fair wind. The night was calm, and we made little progress.

On the 22d we hat light head-winds. A litule hefore noon we passet, with the assistance of wur oars, the lexciençia Straits, the narowest part of the chanmel between batehian and Gilolo. These were well named by the carly Portuguese navigators, as the currents are very strong, and there are so many eddies, that even with a lair wind vessels are often quite unable to pass through them. In the afternoom as strong north wind (dend ahead) obliged us to auchor twice. At night it was calm, and we crept atong slowly with our oars.

On the 2 ded we still had the wind ahend, or calms. We then crossed over again to the mainhud of Cilolo by the advice of our Gani men, who knew the cuast well. Just is we got across we had another mortherly squall with rain, and had to anchor on the edge of a coral reed for the night. I called up my men about three on the moming of the $2 t t h$, but there was no wind to help us, aud we rowed along slowly. At daybreak there was a lair breaze from the south, but it lasted only an hour. All the rest of the day we had nothing lat calms, linht winds allead, and syualls, and made very little payress.

Ont the 2jth we drifted out to the midde of the chamel, but made no progress onward. Ja the atiternoon we sailed and rowed to the sonth end of Kaion, and by minught rathed the villare. I determined to stay here a fesw days
to rest and recruit, and in hopes of getting better weather. I bought some onions and other veretables, and pleaty of eggs, and my men baked fresh sago cakes. I went daily to my old hunting-ground in sentel of insects, hut with very poor success. It was now wet, squally weather, aud there appeared a starnation of insect life. We stayed five days, during which time twelve persous died in the villare, mostly from simple intermittent fever, of the treatment of which the natives are quite ignorant. During the whole of this voyage I had suffered greatly from sun-burnt lips, owing to having exposed myself on deck all day to look after our safety among the shoals and reefs near Waigiou. The salt in the air so affected them that they would not henl, but hecame excessively painful, and bled at the slightest touch, and for a long tine it was with great difficulty I could ent at all, being obliger to open my mouth very whde, and put in each monthitul with the greatest crution. I kept them constantly covered with ointuent, which was itself very distgreeahbe, and they caused me almost constant pain for more than a month, as they aliel not get well till I had returned to Ternate, and was able to reman a weeli indoors.

A boat which left for Termate the day after we arrived, was obliged to return the next day, un account of bad weather. On the 3 Lst we went ont to the anchorage at the moutl of the harbou, so as to be remly to start at the first favourable opportunity.

On the 1st of November I called up my mea at one in the morning, and we started with the tide in our favour: Hitherto it had usually been calm at might, but on this occasion we had a strong westerly squall with rain, which turned our prau broadside, and obliged us to anchor. When it had passed we went on rowing all night, but the wind ahead connteracted the current in our favour, and we advanced but little. Soon after sumbse the wind became stronger and more alverse, and as we had a dangerons lecshore which we could not clear, we lad to put about and get an offing to the W.S.W. This series of contrary winds and bat weather wrus since we started, not having lad a single day of fair wind, was very remarkable. My inen firmly believed there was something unlucky in
the boat, and told me I ought to have had a certain ceremony trone throngh leforg starting, ennsisting of boring a hole in the bottom and pouring some kind of holy oil throngh it. It must be remembered that this was the season of the south-east monsoon, nud yet we had not lam even half a day's sontly-enst wind since we left Waigiou. Contrary winds, squalls, aud curvents drifted us about the rest of the day at their pleasure. The night was equally squally and changeable, aml kept us havd at work taking in and making sail, and rowing in the intervals.

Sunrise on the $2 d$ found us in the midule of the tenmile channel between Kaióa and Makian. Squalls and showers succeeded each ohher haming the morning. At noon there was a dead calm, after which a light westerly breeze enabled us to reach a village on Makian in the eveniug. Here I bought some pumelos (Citrus decumana), kanary-nuts, and coffee, and let my men have a night's sleep.

The moming of the $3 d$ was fine, and we rowed slowly along the const of Makian. Tlue captain of a small prau at anchor, secing me on deck and guessing who I was, made sigmals for us to stop, and brought me a Ietter from Clarles Allen, who informed me he had been at T'ernate twenty days, and was anxionsly waiting my arrival. This was good news, as I was equally anxious about him, anl it cheered up my spirits. A light southerly wind now sprung up, and we thonght we were going to have fine weather. It soon changed, however; to its old quarter, the west; dense clouds gathered over the sky, and in less than half on hour we had the severest squall we had experienced during our whole voyage. Luckily we got our great mainsail down in time, or the consequences might have been serious. It was a regular little hurricane, and my old Bugis steersman began shouting out to "Allah! il Allah!" to preserve us. We could only keep up our jib, which was almost blown to rags, but ly careful handling it kept us before the wind, and the prau behaved very well. Our small boat (purchased at Gami) was towing astern, and soon got full of water, so that it broke away and we saw no more of it. In abont an hour the fury of the
wind abated a little, and in two more we were able to hoist our mainsail, reefed and half-mast ligh. Towards ovening it cleared up and fell calm, and the sea, which had been rather high, soon went down. Not being much of a seaman myself I had been considerably alarmed, and even the old steersman assured me he had never been in a worse squall all his life. He was now more than ever confirmed in his opinion of the unlnckiness of the boat, and in the efficiency of the holy oil which all Bugis prans had poured throngh their bottoms. As it was, he imputed our safety and the quick termination of the squall entirely to his own prayers, saying with a laugh, "Yes, that's the way we always do on board one praus; when things are at the worst we stand up and shout out our prayers as loul as we can, and then Tuwan Allah helps us."

After this it took us two days more to reach Ternate, having our usual calms, squalls, and liead-winds to the very last; and once having to return back to our anchorage owing to violent gusts of wind just as we were close to the town. Looking at my whole voyage in this vessel from the time when I left Goram in May, it will appear that my experiences of travel in a native pran have not heen encouraging. My first crew ran away; two men were lost for a month on a desert island; we were ten times agroumd on coral reefs; we lost four anchors; the sails were devoured by rats ; the small boat was lost astern; we were thirty-eight days on the voyage home, which should not have taken twelve; we were many times short of food and water; we had no compass-lamp, owing to there not being a drop of oil in Waigion when we left; and to crown all, during the whole of our voyages from Goram by Ceram to Waigiou, and from Waigiou to Ternate, ocenpying in all seventy-eight days, or only twelve days short of three montlis (all in what was supposed to be the fiwourable season), we had not one single day of fair wind. We were always close braced up, always struggling against wind, tide, and leeway, and in a vessel that would seareely sail nearer than eight points from the wind. Every seaman will admit that my first voyage in my own boat was a zost unlucky one.

Charles Allen had oltained a tolerable collection of liris and insects at Mysol, but far less than he would have done if I had not been so unfortunate as to miss visiting him. After waiting another week or two till he was nearly starved, he returned to Walai in Ceram, and heard, much to his surprise, that I had left a fortnight hefore. He was delayed there more than a month before le could get lack to the north side of Mysol, which he found a much better locality, but it was not yet the season for the Paradise Birds; and before he had obtained more than a few of the common sort, the last pran was ready to leave for Ternate, and he was obliged to take the oprortunity, as he expected I would be waiting there for him.

This cencludes the record of my wanderings. I next went to Timor, and afterwards to lourn, Java, and Sumatra, which places have already been described. Charles Allen made a voyage to New Guinea, a short account of which will be given in my next chapter on the lizds of Paralise. On lis return he went to the Sula Islands, and made a very interesting collection, which served to determine the limits of the zoological gromp of Celebes, as already explained in my chapter on the natural history of that island. His next journey was to Flores and Solor, where he oltained some valuable materials, which I have used in my chapter on the natural history of the Timor gromp. He afterwards went to Coti on the east coast of Borneo, from which place 1 was very anxious to ohtain collections, as it is a quite new locality as far as possible from Sariwak, and 1 had heard very good accomuts of it. On his return thence to Souradaya in Java, he was to have grone to the entirely unknown Sumba or Sandal-wood Ishand. Must unfortunately, however, he was seized with a terrible fever on his arrival at Cuti, and, after lying there some wreks, was taken to Singapore in a very bad condition, where he arrived after I had lelt for England. When he recovered he obtained employment in Singapore, and I lost his services as a collector.

The three concluding chapters of my work will treat of the Pirds of Paradise, the Natural Ilistory of the Papuan 1slands, and the Races of Man in the Malay Archipelago.

## CHAPTER XXXVIII.

## THE BIRDS OF PARADISE.

AS many of bay journeys wore male will the express object of obtaining speciurens of the Birds of Paradise, and leaming something of their habits and distribution; and leeing (as far as I am aware) the only Englishman who has seen these wonderful hivds in their mative forests, and obtamed specimens of many of them, I propose to give here, in a connected form, the result of my observations and inquiries.

When the earliest European voyagers reached the Moluecas in search of cloves and nutnegs, which were then rare and precions spices, they were presented with the dried skins of hirts so strange and beautiful as to excite the admixation even of those wealth-seeking rovers. The Malay traders gave them the name of "Mamuk dewata," or God's birds ; and the Portuguese, finding that they had no feet or wings, and not being able to learn anything authentic about them, called them "Passaros de Sol," or Birds of the Sun; while the learned Iutchmen, who wrote in Latin, called them "Avis paradiscus," or Paradise Bird. Jolm van Linseloten gives these names in 1598 , and tells us that no one has seen these birds alive, for they live in the air, always tuming towards the sun, and never lighting on the earth till they die; for they have neither feet nor wings, as, he adds, may be seen by the birds carried to India, and sometimes to Holland, but being very costly they were then rarely seen in Jurope. More than a hundred years later Mr. William Funuel, who accompanied Dampier, and wrote an account of the voyage, saw specimens at Amboyna, and was twh that they came to Bauda to eat nutmegs, which intoxicated them and mate them fall town senseless, when they were killed by ants. Down to 1760, when Limaus named the largest species, Paradisea apoda (he footless Paradise Bird), no perfect specimen had been seen in Europe, and abso-

Jutely nothing was known about then. And even now, a hundred years later, most books state that they migrate annually to Ternate, Banda, and Amboyna; whereas the fact is, that they are as completely muknown in those jslauds in a wild state as they are in Eugland. Limmens was also aequaintel with a small species, which he named Paradisea regia (the King Bind of Patadise), and since then nine or ten others have been named, all of which were first descrihed from skins [reserved by the savarers of New Guinea, and generally more or less imperlect. These are now all known in the Malay Archipelaco as " Hurong mati," or dead birds, indicating that the Malay traders never saw them alive.

The Paradisellie are a group of moderate-sized birds, allied in thuir structure and habits to crows, stanlings, and to the Australian honeysuckers; but they are characterised by extraodinary developments of plumage, which are unequalled in any other family of birds. In several species large tufts of delicate loright-coloured feathers spring from each side of the body bencath the wiugs, forming trains, or fans, or shielts; and the mitdle feathers of the tail are often elongated into wires, twisted into fantastic shapes, or adomed with the most brilliant metallic tints. In another sel of species these accessory plumes spritug from the heal, the back, or the shoulders; while the intensity of colour and of metallie lustre displayed by their plumage, is not to he equalled by any other birds, except, perhaps, the humming-lirds, and is not surpassed even by these. They have been usually classified under two distinct families, Paradiseida and Epimachide, the latter characterised by long and slender beaks, and suppinsed to be allied to the Hoopoes; but the two groups are so closely allied in every essential point of structure and habits, that I shall consider them as forming sublo divisions of one family. 1 will how give a short deseription of each of the known species, and then add some general remarks on their natural history.

The Great Bird of l'aradise (Paradisea apoda of Linnæus) is the largest species known, being generally seventeen or eighteen inches lionn the beak to the tip of
the tail. The boty, wings, and tail are of a rich culfeebrown, which deepens on the breast to a blackish-violet or purple-brown. 'lhe whole top of the head and neek is of an exceelingly delicate straw-yellow, the feathers being short and close set, so as to resemble phash or velvet; the lower part of the throat up to the eye is clothed with sealy feathers of an enematu green colour, and with a rich metailic gloss, and velvety plunes of a still deeper green extend in a band apross the forehend and chin as far as the eye, which is bright yellow. The beak is pale lead blue; and the feet, which are rather lapge and very stron and well furmed, are of a pale ashypink. The two midde featlers of the tail have no wels. except a very small one at the lase and at the extreme tip, fomming wive-like circhi, which spreal out in an elegant double curve, and vary from twenty-four to thirty-four inehes long. From each side of the bouly, bencath the winges, springs a dense tuft of long and delicate plumes, sometimes two feet in length, of the most intense gollen-orange colour and very glossy, lut changing towards the tips into a $p^{\text {ala }}$ brown. This tuft of plumage can be elevated and spread out at pleasure, so as almost to conceab the burly of the bird.

These splendid ornaments are entirely coulined to the male sex, while the female is really a very platin and ordinary-looking bird of a aniform coffee-brown colour which never changes, neither dues she possess the long tail wires, nor a sibgle yelluw or green tather about the head. The young males of the first year exactly resemble the females, so that they can only be distimguished by dissection. The lirst change is the acquisition of the yellow and green colow on the head and throat, and at the same time the two middle tail feathers grow a few inches louger than the rest, but remain webbed on both sides. At a later period these feathers are replaced by the long bare shatts of the full leugth, as in the adult bird; but there is still no sign of the magnilicent oramge side-plumes, which later still complete the attire of the perfect male. To effect these changes there must be at jeast three successive moultings and ats the birds were found by me in all the stages about the same time, it is probable that they moult only once a year, and that
the full plumage is not acquired till the bird is four years old. It was long thought that the fine train of feathers was assumed for a short time only at the breeding season, but my own experience, as well as the observation of birds of an allied species which I brought home with me, and which hived two years in this country, show that the complete plumage is retained during the whole year, axcept iluring a short period of moulting as with most other birds.

The Great Bird of Paradise is very active and vigorous, and seems to be in constant motion all day long. It is very abundant, small flocks of females and young males being constantly met with; and though the full-phumaged birds are less plentiful, their loud cries, which are heard daily, show that they also are very numerons. Their note is, "Wawk-wawk-wawk-Wuk, wŏk-wŏk," and is so loud and shrill as to be heard a great distance, and to form the most prominent and chavacteristic mimal sound in the Aru Islands. The mode of niditication is unknown; but the natives told me that the nest was formed of leaves placed on an ant's nest, or on some projecting limb of a very lofty tree, and they believe that it contains ouly one young bird. The egg is quite unknown, and the natives dechared they had never seen it; and a very high reward offered for one by a Dutch ofticial did not meet with suecess. They moult about Janumy or February, and in May, when they are in full plumage, the males assemble early in the morning to exhibit themselves in the singular maner ahready described at p. 463. This habit enables the natives to obtain specimens with comparative case. As soon as they find that the binds have fixed upon a tree on which to assemble, they build a little shelter of palm leaves in a convenient place among the branches, and the hunter ensconces himself in it before daylight, armed with his bow and a mumber of arrows terminating in a round knob. A boy waits at the foot of the tree, and when the birds come at sumpise, and a sufficient number have assembled, and have bergn to dauce, the huater shoots with his bunt arrow so strongly as to stun the bird, which drops down, and is secured and killed by the boy without its plumare being injured
by a drop of blood. The rest take no notice, and fall one alter another till some of them take the alarm. (See Illustration facing p. 443.)

The native mole of preserving them is to cut of the wings and feet, and then skin the bolly up to the beak, taking out the skull. A stout stick is then run up through the specimen coming out at the mouth. Round this some leaves are stulfed, and the whole is wrapped up in a palm spathe and dried in the smoky hut. By this plan the head, which is really large, is shrunk up almost to nothing, the body is much reduced and shortened, and the greatest prominence is given to the flowing plumage. Some of these native skins are very clean, and often have wings and feet left on; others are dreadfully stained with smoke, and all give a most erroncous idea of the proportions of the living bird.

The Paradisea apoda, as far as we have any certain knowledge, is contined to the mainland of the Aru Islands, never being found in the smaller islands which surround the central mass. It is certainly not found in any of the parts of New Guinen visited by the Malay and Bugis traders, nor in any of the other islands where Birds of Paradise are obtained. But this is by no means conclusive evidence, for it is only in certain localities that the natives prepare skins, and in other places the same birds may be alundant without ever becomiag known. It is therefore quite possible that this species may iuhabit the great southern mass of New Guinea, from which Aru has been separated; while its near ally, which I shall next descrive, is contined to the north-western peninsula.

The Lesser Bird of Paradise (Taratisea papuana of Bechstein), "Le petit Emeraude" of Freuch authors, is a much smaller bird than the preceding, although very similar to it. It differs in its lighter brown colour, not becoming darker or purpled on the breast; in the extension of the yellow colour all over the upper part of the buck and on the wing coverts; in the lighter yellow of the side plumes, which have only a tinge of orange, and at the tips are nearly pure white; and in the comparative shortness of the tail circhi. The female differs remarkably from
the same sex in Paradisea apoda, by leing entirely white on the under surface of the body, and is thus a much handsomer bird. The young mates are similarly coloured, and as they grow older they change to brown, and go through the same stages in acquiring the perfect phomage as has already been deseribed in the allied species. It is this hird whiel is most commonly used in ladies' head-dresses in this country, and also furms an inportant article of commerce in the Last.

The Paradisea papuana has a comparatively wide rauge, being the common species on the mainland of New Guinea, as well as on the islands of Mysol, Salwatty, Jobie, Biak and Sook. On the south const of New Guinta, the Duteh naturalist, Muller, found it at the Oetanata river in lungitude $136^{\circ} \mathrm{E}$. I obtaned it myself at Dorey; and the captain of the Dutch steamer Sthe informed me that he had seen the feathers among the natives of Humboldt Bay, in $141^{\circ} \mathrm{E}$. longitude. It is very probable, therefore, that it ranges over the whole of the mandand of New Guinea.

The thue laradise Pirds are omnivorous, feeding on fruits and inseets-of the former preferring the small figs ; of the latter, grasshoppers, locusts, and phasmas, as well as cockroaches and caterpillars. When I returned home, in 1862, I was so fortunate as to find two adult males of this species in Singapore; and as they seemed healthy; and fed voracionsly on rice, bauanas, and cockroaches, I determined on giving the very high price asked for them-100t-and to bring them to England by the overland route under my own care. On my way lome I stayed a week at Bomlay, to break the journey, and to lay in a fresh stock of bananas for my birds. I had great difheulty, however, in supplying them with insect food, for in the Peninsular and Oriental steaners cockronches were scarce, and it was only by setting traps in the store-rooms, and by hunting an hour every night in the forecastle, that I could secure a few dozen of these creatures,-sarcely enough for a single meal. At Malta, where I stayed a fortnight, I got plenty of cockroaches from a bakehouse, and when I left, took with me several biscuit-tins' full, as provision for the voyage home. We came though the Mediterranean
in March, with a very cold wind; and the only place un board the mail-steamer where their large cage could be accommodated was exposed to a strong enment of air down a hatehway which stood open day and night, yet the birds never seemed to feel the cold. During the night juurney from Marseilles to Paris it was a sharp frost; yet they arrived in London in perfect hoalh, and lived in the Zoological Gimens for one, and two years, often displaying their beautiful plumes to the admiration of the spectators. It is evident, therefore, that the Paradise Birds are very harly, and require air and exurcise rather than heat; and I feel sure that if a good sized conservatory could be devoted to them, or if they could be turned loose in the tropical department of the Crystal Palace or the Great Pahi Louse at Kew, they would live in this country for many years.

The Red Bird of Paradise (Paradisea rubra of Vielloti, though allied to the two birds already described, is much more distinct from them than they are from each other. It is about the same size as Paradisen papuana ( 13 to 14 inches longy, but differs from it in many particulars. The side plumes, instead of being yellow, are rich crimson, and only extend about three or four iuches beyond the end of the tail; they are somewhat rigid, and the ends are curved downwarls and inwards, and are tipped with white. The two middle tail feathers, iustead of being simply elongated and deprived of their wels, are transformed into stiff black ribands, a quarter of an inch wide, but curved like a split quill, and resembling thin hadf cylinders of horn or whalebone. When a dead bird is lad on its back, it is seen that these ribands take a curve or set, which brings them round so as to meet in a double circle on the neek of the bird; but wheu they hang dowuwards, during life, they assume a spiral twist, and form an exceedingly graceful double curve. They are about twenty-two inches long, and always attract attention as the most conspicuous and extraondinary feature of the species. The rich metallic green colour of the thront extends over the front half of the head to behind the eyes, and on the forehead forms a little double crest of scaly feathers, which adds much to
the vivacity of the bird's aspee: The bill is gamboge yellow, and the ris blackish olive. (Figure at p . 215 .) 5

The female of this species is of a tolerably uuiform coffe-hrown colour, but has a blackish head, and the nape. neck, and shoulders yellow, indicating the position of the brighter colours of the male. The changes of phmare follow the sane order of succession as in the other species, the bricht colows of the head and neek being first developeed, then the lengthened filaments of the tail, and last of all, the red side plumes. I oltamed a series of specimens, illustrating the mamer in which the extraordinary black tail ribauds are developel, which is very remarkable. They first appear as two ordinary feathers, rather shorter than the rest of the tail; the secend stage would no doult be that shown in a speeimen of Paradisea apoda, in which the feathers are moderately leugthened, and with the web narrowed in the midlate; the third stage is shown by a specimen which has part of the midrib bare, and terminatel by a spatulate web; in mother the bare midrib is a little dilated and stmi-cylindrical, and the terminal wel very small; in a fith, the perfect Llack horny ribaud is formed, but it bears at its extremity a hrown spatulate web, while in auother specimen, part of the black ribaud itself bears, ou one of its sides only, a narrow brown web. It is only atter these changes are fully completed that the red side plumes begin to appear.

The successive stares of development of the colours and plumage of the Birds of Paradise are very interesting, from the striking manner in which they accord with the theory of their having been produced by the simple action of variation, and the cumulative power of selection by the females, of thuse male birls which were more than usually ornamental. Variations of colser are of all others the most frequent and the most striking, and are most easily modified and aceumulated by man's selection of them. We should expect, therefore, that the sexual differences of colour would be those most early aconmulated and fixed, and would therefore appear sonnest in the young birds; and this is exactly what occurs in the Paradise Birds. Of all variations in the form of linds' feathers, none are so frequent as thuse in the hend aul tail These oceur more
or less in every family of birds, and are easily produced in many domesticated varieties, while unusual developments of the feathers of the body are rare in the whole class of birds, and have seldom or never occurred in domesticated species. In accordance with these facts, we find the sealeformed plumes of the throat, the crests of the head, and the long cirrhi of the tail, all fully developed before the plumes which spring from the side of the body begin to make their appearance. If, on the other hand, the male Paradise Dirds have not aequired their distinctive plumage by successive variations, but have been as they are now from the moment they first appeared upon the earth, this succession becomes at the least unintelligible to us, for we can see no reason why the changes should not take place simultaneously, or in a reverse order to that in which they actually occur.

What is known of the habits of this bird, and the way in which it is captared by the natives, have already been deseribed at page 534 .

The Red Bird of Paradise offers a remarkable case of restricted mane, being entirely confined to the small island of Waigion, off the north-west extremity of New Guinea, where it replaces the allied species found in the other islands.

The three birds just described form a well-marked group, agreeing in every point of general structure, in their comparatively large size, the brown colour of their borlies, wings, and tail, and in the peculiar character of the ornamental plumage which distinguislies the male bird. The group ranges nearly over the whole area inhalited by the family of the Faradiseidae, but each of the species has its own limited recrion, and is never found in the sane district with either of its close allies. To these three birds properly belongs the generic title Paradisea, or true Paradise Bird.

The next species is the Paradisea regin of Linnzeus, or King Bird of Paradise, which differs so much from the three preceding species as to deserve a distinct generic name, and it has accordingly been called Cicinnurus regius. Dy the Malays it is called "Buroner rajah," or King Bird, und by the natives of the Aru Islauds "Goby-groby."

This levely little bird is only ahout six and a half inches long, partly owing to the very short tail, which dows not surpass the somewhat square wings. The heal, thrmat. and entire upper surface are of the richest glossy chmon red, shating to orange-crimson on the furchead, where the feathers extend heymb the nostrils more than half-way down the bak. The plumage is excessively brilliant, shining in certain lights with a metallic or glassy lustre. The breast and belly are pure silky white, lutween which enlour and the red of the throat there is a lroad band of rich metallic green, and there is a small spot of the same colour close above each eye. From each site of the boty beneath the wing, springs a tuft of boad delicate leathers about an inch and a half long, of an ashy colour, hut tipred with a broad hand of ememald ereen, bordered within by a narow line of buff. These plumes are concealed beneatif the wing, but when the bird pleases, can be raised and spead out so as to form an clegant semicireular fan on each shoulder. But another omament still more extraodimary, and it possilide more twatiful, adons thes little bind. 'The two middle tail featiers are modified into very slender wire-like shafts, nearly six inches loug, ench of which bears at the extremity, on the inner side only, a web of an emerald green coluur, which is coiled up into a perfect spiral dise, and produces a hoost simpular and charming effect. The bill is orange gellow, and the fect and legs of a fine cobalt blue. (See upper firgure on the flate at the commencement of this chapter.)

The femate of this little gem is such a plainly coloured bird, that it can at first sight hardy be believed to belong to the same species. The upper surface is of a dull earthy brown, a slight tinge of orange red appearing only on the margins of the quills. Buneath, it is of a paler yellowish brown, scaled and banded with narrow dusky ratkings. The young males are extctly like the female, and they no doult undergo a series of changes as singulat as those of Paralisea rubra; but, unfortunately, I was unable to abtain illustrative specimens.

This exquisite little creature trequents the smaller trees in the thickest parts of the forest, feeding on various fruits, often at a very large size for so small a lird. It is very
active both on its wiugs and feet, and makes a whiming sound while flying, something like the Sonth Amrrican manakins. It aften flutters its wings and displays the beautiful fan which adorns its breast, while the starbearing tail wires tiverge jn an elegant foulle curve. It is toherably pleatilul in the Aru Islauds, whied led to its being brought to Enrope at an parly period along with Paradisea apola. It also necurs in the ishand of Mysul, and in every part of New Guinea which has been visited by naturalists.

We now come to the remarkalle little liur called the "Magniticent," first figured by Buffon, and named Pira-

disea speciosa by Toddart, which, with one allied specios, has lieen formed into a separate genus by Prince Puomaparte, under the mame of Diphyllodes, from the curious double mantle which clothes the back.

The head is covered with short brown velvety feathers, which advance on the back so as to cover tie nostrils. From the mape springs a dense mass of feathers of a strawyellow colour, and about one and a hali inches long, lurming a mantle over the upper part of the back. Peneath
this, and forming a band about one-third of an inch beyoud it, is a second mantle of rich, glossy, reddish-brown feathers. The rest of the back is orange-brown, the tailcoverts and tail dark bronzy, the wings light orange-buff. The whole under surface is covered with an abundance of plumage springing from the margins of the breast, and of a rich deep green colour, with changeable hues of purple. Nown the middle of the breast is a broad band of scaly plumes of the same colour, while the chin and throat are of a rich metallic bronze. From the middle of the tail spring two narrow feathers of a rich steel blue and about ten inches loug. These are webled on the inner side only, and curve outward, so as to form a double circle.

Frem what we know of the luabits of allied species, we may loe sure that the greatly develored plumage of this bird is erected and displayed in some remarkable manner. The mass of feathers on the under surface are probably expanded into a hemisphere, while the beautiful yellow mantle is no doubt elevated so as to grive the bird a very different appearance from that which it presents in the dried and flattened skins of the natives, through which alone it is at present known. The feet appear to be dark blue.
This rave and elegant little bird is found only on the manlamb of New Guinea, and in the island of Mysol.

A still more rare and beautiful species than the last is the Diphyllodes wilsoni, described ly Mr. Cassin from a native skin in the rich museum of Philadelphia. The same bird was altenwards named "Diphyllorles respublica" by Prince Buonaparte, amd still later, "Schlegelia calva," by Dr. Jernstein, who was so fortunate as to obtain fresh specimens in Waigiou

In this species the upper mantle is sulphur yellow, the lower one and the wings pure red, the breast plumes dark green, and the lengthened middle tail feathers much shorter than in the allied species. The most curions difference is, however, that the top of the head is bald, the hare skin being of a rich colvalt blue, orossed by several lines of black velvety feathers.

It is about the same size as Diphyllodes speciosa, and is uo doubt eatirely conlined the the island of Waigion. 'The female, as tigured and leseribed by Dr. Bernstem, is very like that of Ofinnusus rogins, being similany handed beneath; and we may therefore conclude that its nome ally, the "Magniticent," is at least equally pain in this sex, of which specimens have not yet been obtained.

The Superb Bird of Parmise was first figured by Buffon, and was named by Bonddert, I'aradisea atta, from

tie fupets miad of rabablate (Lophorinatafra.)
the black gronnd colour of its plumage. It forms the genus Lophorma of Viellot, and is one of the rarest and most brilliant of the whole group, being only known from mutilated native skins. This bird is a little larger than the Magniticent. The ground colour of the plumage is intense black, but with beatitul brome reflections on the neek, and the whole head senled with feathers of brilliant metallic green and blue. Over its breast it bears a shield fonmed of aurow and rather stiff fenthers, much elongated towands the sides, of a pure bluish-green colour, and with a satiny gloss. But a still more extroordinary ormament is that which springs from the back of the neck,--a shidd of a similar form to that on the breast, but much larger,
and of a velvety black colour, glossed with bronze and purple. The ontermost feathers of this shicld are half an inch longer than the wing, and when it is elevated it must, in conjunction with the breast shiehl, completely change the form and whole appearance of the bird. The bill is black, and the feet appear to be gellow,

This womlerful little bird inhabits the interior of the northern peninsula of New Guinea only. Neither I nor Mr. Allen could hear anything of it in any of the islands or on any part of the coast. It is true that it was obtained from the coast-natives by Lesson; but when at Sorong in $1861, \mathrm{Mr}$. Allen learnt that it is only found three days' journey in the interior. Owing to these "Black Birds of Paradise," as they are called, not being so much valued as articles of merchandise, they now seem to be rarely preserved ly the natives, and it thus happened that during several years spent on the coasts of New Guinea and in the Moluceas I was never able to obtain a skin. We are therefore quite ignorant of the habits of this bird, and also of its female, thongh the latter is no doubt as plain and inconspicuous as in all the other species of this tamily.

The Golden, or Six-shafted Paradise Bird, is another rare species, first figured by Butfon, and never yet obtainel in perfect condition. It was named by Boddaert, Paradisen sexpennis, and forms the genus Parotia of Viellot. This wonterful bird is about the size of the female Paradisea rubre. The plumage appears at first sight black, but it glows in certain lights with bromze and deep purple. The throat and breast are sealed with broad that fathers of an intense golden hee, changing to green and blue tiots in certain lights. On the back of the leat is a broad recurved band of feathers, whose brillianey is intescribable, resembling the sheen of cmerald and topaz rather than any organic substance. Over the foreheat is a large patch of pure white feathers, which shine like satin; and from the sides of the head spring the six wonderful feathers from which the bird receives its name. These are slenter wires, six inches long, with a small oval web at the extremity. In
addition to these ornments, there is also an immense toult of solt feathers on wach side of the brenst, which when eferated must entirely hide the wings, and give the bind an appearance of being double its real bulk. "Itre bill is black, short, and rather compressed, with the leathers advancing over the nostrils, as in Ciemmums ragius. This singular and brilliant himd inhabits the same region as the Supers Pird of l'aradise, and nothing whatever is known about it but what we can clerive from an examination of the skins preserved by the natives of New Guinea.

The Standard Wing, named Semioptera wallacei by Mr. (3. R. Gray, is an entirely new form of Bird of lamalise, discovered by myself in the island of Patchian, and especially distinguished by a pair of long narrow feathers of a white colour, which spring from anong the short phomes which clothe the bend of the wing and are capable of being erected at pleasure. The general colom ol this bird is a delicate olive-hrown, deepening to a kind of bronzy olive in the middle of the back, and changing to a delicate ashy violet with a metallic gloss, on the crown of the heat. The feathers, which cover the nostrils and extend half-way
down the beak, are loose and curved upwards. Bencath, it is much more henutiful. The seale-like feathers of the heanst are margineal with rich metallic bhe-grean, which colour entively covers the throat and sides of the neek, as well as the hom pointed phones which spring from the siles of the breast, and extend nearly as far as the end of the wings. The most curious fature of the birl, however, and one altogether unimue in the whole class, is foumd in the pair of long narow delicate feathers which suring from ead wing close to the bead. On liftine the wingcoverts they are seen to arise from two tuhnlar horny sheaths, which diverge from near the point of punction of the carpal bones. As already described at p. 329, they are erectile, and when the hiral is excited are spreat out at right mugles to the wing ant slightly divergent. They are from six to six and a half inches long, the upper one slightly excevaing the lower. The total length of the bird is eleven inches. The bill is homy olive, the iris deep olive, and the feet bright orange.

The female bird is remarkably plain, being entirely of a dull pate chuthy brown, with only a slight tinge of ashy violet on the liead to relieve its general monotony; and the young males exactly resemble ler. (See ligures at p. 328.)

This bird frequents the lower trees of the forests, and, like most Paradise Birds, is in constant motion-flying from branch to branch, clinging to the twigs and even to the smooth and vertical trunks almost as easily as a woodpecker. It continually utters a harsh, ereaking note, somewhat intermediate between that of Paradisa apoda and the more musical ery of Cicinmurns rerins. The males at short intervals open and fhuter their wings, erect the long shoulder feathers, and spread out the elegant green breast shields.

The standard Wing is fonnd in Gilolo as well as in Batchian, and all the specimens from the former island have the green breast shield rither louger, the crown of the houd darker violet, and the lower parts of the body rather more strongly scaled with green. This is the only Paradise Bird yet fomm in the Molncean district, all the othors being contined to the Prpuan Islands and North Australia.

We now come to the Epimachide, or Long-billed Sirds of Paradise, which, as before stated, ought not to be sephrated from the [aradisedie by the intervention of any other birds. One of the most remarkable of these is the Twelve-wired Paradise Bird, I'aradisa alba of Blumenbach, but now placed in the genus Selencides of Lesson.

This bird is about twelve inches long, of which the connpressed and curved loak cocupies two inches. The coluur of the breast and upper surtace appears at tirst sight nearly black, but a close examination shows that no part of it is devoil of colour; and by holding it in various lights, the most rich and glowing tints become visible. The head, covered with short velvety feathers, which advance on the chin much further thas on the upper part of the beak, is of a purplish hronze colour; the whole of the back aud shoulders is rich bronzy green, while the closed wings and tail are of the most brilliant violet purple, all the plumage having a delicate silky gloss. The mass of feathers which cover the breast is really almost black, with faint glosses of green and purple, but their vuter edges are margined with glittering bunds of emerald green. The whole lower part of the body is rich bully yellow, including the tuft of plumes which spring from the sides, and extend an inch and a halt beyoud the tail. When skins are exposed to the light the yellow lades into dull white, from which circumstance it derived its specific name. About six of the imermost of these plumes on each side have the midrib elongated into slender black wires, which bend at right augles, and curve somewhat backwards to a length of about ten inches, forming one of those extraorlinary and fantastic ornanents with which this group of birds abounds. The bill is jet black, and the feet bright yellow. (See lower figure on the plate at the begiming of this chapter).

The female, although not quite so plain a bind as in some other species, presents none of the gay coluurs or ornamental plunare of the male. The top of the head and back of the neck are bhack, the rest of the upper parts rich reddish brown; while the under surface tis entirely yellowish ashy, somewhat blackish on the breast, and crossed throughout with narrow blackish wavy bands,

The Seleucides alba is found in the island of Salwatty, and in the north-western parts of New Guina, where it frequents flowering trees, especially sago-palms and pandani, sucking the flowers, round and beneath which its unusually large and powerful feet enable it to cling. Its motions are very rapid. It sehom rests more than a few moments on one tree, after which it flies straight off, and with great swiftness, to another. It has a loud shill ery, to be heard a long way, consisting of "Cáh, cáh," repeated five or six times in a descending scale, and at the last note it gencrally flies away. The males are quite solitary in their habits, although, perhaps, they assemble at certain times like the true Paradise Birds. All the specmens shot and opened by my assistant Mr. Allen, who obtained this fine bird during his last voyage to New Guinea, had mothing in their stomachs but a brown sweet liquid, probably the nectar of the flowers on which they had been feeding. 'They certainly, however, eat buth fruit and insects, for a specimen which I saw alive on board a Dutch steamer ate cockroaches and papaya fruit voraciously. This bird had the curious habit of resting at noon with the bill lointing vertically upwards. It died on the passage to Batavia, and I secured the body and formed a skeleton, which shows indisputably that it is really a Bind of Paradise. The tongue is very long and extensible, but flat and a little fibrous at the end, exactly like the true Paradiseas.

In the island of Salwatty, the natives search in the forests till they find the sleeping place of this bird, which they know by seeing its dung upon the ground. It is generally in a low bushy tree. At night they climb up the tree, and either shoot the birds with blunt arrows, or even catch them alive with a cloth. In New Guinea they are canght by placing suares on the trees frequented by them, in the same way as the Red Paradise Birds are caught in Waigiou, and which has already been described at page 534.

The great Epimaque, or Long-tailed Paradise Bird (Epimachus magnus), is another of these wonderful creatures, only known by the imperfect skins prepared by the natives, In its dark velvety plumage, glossed with bronze
and purple, it resembles the Seleucides alba, but it bears a magnilicent tail more than two feet long, glossed on the upper surface with the most intense opalescent bluc. Its chief ornament, however, consists in the group of broad plumes which spring from the sides of the breast, and which are dilated at the extremity, and banded with the most vivid metallic blue and green. The bill is long and curved, and the feet black, and similar to those of the allied forms. The total length of this fine bird is between threo and
 four feet.

This splendid bird inhabits the mountains of New Guinea, in the same district with the Superb and the Sixshafted Paradise Birds, and I was informed is sometimes found in the ranges nuar the coast. I was several times assured by different natives that this bird makes its nest in a hole under ground, or under rocks, always choosing a place with two apertures, so that it may enter at one and go out at the other. This is very unlike what we should suppose to be the habits of the bird, but it is not easy to conceive how the story originated if it is not true; and all travellers know that native accounts of the batits of animals, however strange they may seem, almost invariably turn out to be correct.

The Scale-breasted Paradise Bird (Epimachus magnificus of Cuvier) is now generally placed with the Australian Rifle birds in the geaus Ptiloris. Though very beautif'h,
these birls are less strikingly decomted with accessory phomage than the other species we have been describing, their chief ornament being a nore or less developed breastphate of stilf netallic green feathers, and a small tuft of somewhat hairy phmes on the sides of the breast. The back and wings of this species are of an intense velvety hack, faintly glossed in certain lights with rich purple. The two brual middle tail feathers are opaleseent greenhue with a velvety surface, and the top of the head is covered with feathers resembling seales of harnished steel. A large niangular space covering the chin, throat, and breast, is densely scaled with feathers, luving a steel-blue or green lustre, and a silky feel. This is edged below with a narrow band of black, followed by shiny bronzy green, helow which the body is covered with hairy feathers of a rich claret colour, deepening to black at the tail. The tutts of side plumes somewhat resemble those of the true Birds of Paralise, but are scanty, alout as long as the tail, and of a blaek colour. The sides of the head are rich violet, and velvety feathers extend on each side of the beak over the nostrils.

I obtained at Dorey a young male of this bird, in a state of plumage which is no doubt that of the adnlt femate, as is the case in all the allied species. The upper surface, wings, and tail are rich reddish brown, while the under surface is of a pale ashy colour, closely barred thronghout with narrow wayy black bands. There is also a pale banded strime over the eye, and a long dusky stripe from the gape down each side of the neck. This bird is fourteen inches long, whereas tho native skins of the adult male are only about ten inches, owing to the way in which the tail is phshed in, so as to give as much prominence as possible to the omamental plumage of the breast.

At Cape York, in North Australia, there is a closely allied species, I'thonis alberti, the female of which is very similar to the young mate bird here described. The beantiful Fille Birds of Australia, which much resemble these Paradise Birds, are maned I'tiloris paradisens and Ptiloris victorise. The Scale-breasted I'urthse Bird seems to be contined to the mainlund of Now Guines, and is less rare than several of the other species.

There are three other New Guinea birds which are by some nuthors chassed with the Birds of Praradise, and which, being almost equally remarkable for splendid plumage, deserve to be noticed here. The first is the Paradise pie (Astrapia nigra of Lesson), a bird of the size of Paradisea rubra, but with a very long tail, glossed above with intense violet. The back is bronzy black, the lower parts green, the throat and neek bordered with loose broal feathers of an intense coppery hue, while on the top of the loed and neck they are glitterimg emerald green. All the plumage round the head is lengtheued and erectile, and when spread out by the living bird must have an effect lardly surpassed by any of the true Paradist Birds. The bill is black and the feet yellow. The Astrapia seems to me to be somewhat internediate between the Paradiseidm and Epimachide.

There is an allied species, laving a bare earnonatated head, which has been called laradigalla carumenlata. It is believed to inlabit, with the preceding, the mountainous interior of New Guinen, but is exceelingly tare, the only kuown specinen being in the lhiladelphia Museum.

The Paradise Oriole is another beautiful lird, which is now sometimes classed with the Birds of Iraradise. It has been named Paradisea aurea and Uriolus aureus by the old naturalists, and is now generally placed in the same genus as the Regent Bird of Australia (Sericulus chrysocephalus). But the form of the bill and the character of the plumage seem to me to be so dilferent that it will have to form a distinct genus. This bird is almost entirely yellow. with the exception of the throat, the tail, and part of the wings and back, which are black; but it is chietly charaeterised by a quantity of long feathers of an inteuse glossy orange colour, which cover its neck down to the middle of the back, ahosst like the hackles of a game-cock.

This beautiful bird inhabits the mainland of New Guinea, and is also found in Salwatty, but is so rare that 1 Was only able to obtain one imperfect native skin, and nothing whatever is known of its habits.

I will now give a list of all tho Bimds of Paradise yet known, with the places they are believed to inhabit.

1. Paradisea apada (The Great Paralise Birl), Ara Islands.
 Jobie.
2. Puradisea rubra (The Red Puadise Birl). Waigion.
3. Cichanarms regills (The Kiug Paradise Bird). New Guinen, Aru Islands, Mysol, Sulwatty.
4. Diphyllodes ofreciuss (The Mugnificent). Netr Guinea, Mysol, Sal. Watly,
5. Diphyllodes wilsoni (The Red Magnifient). Wagiou.
6. Lofhorina atra (The Sulerb). New Guinea.
7. 1'urotia sespennis (The Gohlen Paraliso Bixd). New Guinea.
8. Seruioptera wallacei (The Standaril Wing). Batchian, Gilolo.
9. Ephimathas magnus (The Longtailed Paradise Birdy. New Guinea

11, Seleueides alla (The Twelve-wired laralise Bird). New Guinea, Salwatty.
12. $1^{\text {titiloris }}$ magnifiea (The Scalc-hreasted Paralism Bird). New Gninea.
13. 1'tiloris allertij (Prince Albert's Paradiso Bird). North Australiih
14. P'iloris paazadiseas (Tho litille Bird). Last Australin.
15. P'iloris vietorie (The Yivtorian Rifle Bärd). North-East Ausralia.
16. Astrapia nigra (The Patadise Piv), New Guinea.
17. Pamuligalla carunculata (The Carunculated Paradise Pie). New Guinea.
18. (7) Sericulus nureus (The Paradise Oriole). New Guinen, Salwatty.

We see, therefore, that of the cighteen species which seem to deserve a place anong the birds of Paradise, eleven are known to inhabit the great island of New Guinea, eight of which are entirely confined to it and the bardly separated island of Salwatty. But if we consider those islands which are now united to New Guina by a shallow sea to really form a part of it, we shall find that fourteen of the Paradise Birls belong to that comitry, while three inhabit the northern and eastem parts of Australia, and one the Mohecas. All the more extraordinary and marnificent species are, however, entirely confined to the Papuan region.

Although I devoted so much time to a suarch after these wonderful birds, 1 only succeded mysell in obtaining five species during a residence of many mouths in the Aru Islands, New Guinea, and Waigiou. Mr. Allen's voyage to Mysol did not procure is single additional species, but we both heard of a place called Sorong, on the mainland of New Guinea, near Salwatty, where we were told that all the kinds we dasired could be obtained. We therefore determined that he should visit this place, and endeavour to penetrate into the interior among the natives, who actually shoot and skin the Dirds of Paradise.

He went in the small man I had fitted up at Goram, and through the kind assistance of the Dutel Resident at Ternate, a lieutenant and two soldiers were sent by the Sultan of Tidore to accompany and protect him, and to assist him in getting men aud in visiting the interior.
Notwithstanding these precautions, Mr. Allen met with difliculties in this voyage which we had neither of us encuantered betore. To understand these, it is necessiry to consider that the Birds of Panalise are an article of commerce, and are the monopoly of the chiefs of the coast vilhages, who obtain them at a low rate from the mountaincers, and sell them to the Bugis traders. A portion is also paid every year as tritute to the Sultan of Tidore. The natives are therefore very jealous of a stranger, especially a European, interfering in their trade, and above all of going into the interior to deal with the mountaneers thenselves. They of course think he will raise the prices in the interior, and lessen the supply on the coast, greatly to their disadvantage; they also think their tribute will be raised if a Luropean takes back a quautity of the rare sorts; and they have besides a vague and very matural dread of some ulterior object in a white man's coming at so much trouble and expense to their country only to get Birds of Paradise, of which they know he can buy plenty (of the common yellow ones which alone they value) at Ternate, Macassar, or Singapore.

It thus happened that when Mr. Allen arrivel at Sorong, and explained his intention of going to seck Birds of Paradise in the interior, inmmerable objections were raised. He was told it was three or four days journey over swamps and mountains; that the mountaineers were savages and camnibals, who would certainly kill him; and, lastly, that not a man in the village could be found who dare go with him. After some days spent in these discussions, as he still persisted in making the attempt, and showed them his authority from the Sultan of Tidore to go where he pleased and receive every assistance, they at length provided him with a boat to go the first part of the journcy up a river; at the same time, bowever,
they sent private orders to the interior villages to refuse to sell any provisions, so as to compel him to return. On arriving at the village where they were to leave the river and strike inland, the coast people returned, leaving Mr. Allen to get on as he could Here he catled on the 'lidore lientenant to assist him, and procure men as guides and to carry his baggage to the villarges of the mountaineers. This, however, was not so easily done. A quarrel took place, and the natives, refusing to obey the imperious orders of the lieutenant, fot out their knives and speats to attack him and his soldiers; and Mr. Allen himselt was obliged to interfere to protect those who had come to guard him. The respect due to a white man and the timely distribution of a few presents prevailed; and, on showing the kuives, hatchets, and beads he was willing to give to those who accompanied him, peace was restored, and the next day, truvelling over a frightfully rugged country, they reached the villages of the mountaineers. Here Mr. Allen remainel a month without any interpreter through whom he could understand a word or communicate a want. However, by signs and presents and a protty liberal barter, he got on very well, some of them accompanying him every day in the forest to shoot, and receiving a small present when he was successful.

In the grand matter of the Paradise Birds, however, little was done. Only one additional species was found, the Seleucides alba, of which he had already obtained a specimen in Salwatty; but he learnt that the other kinds, of which he showed them drawings, were found two or three days' journey farther in the interior. When I sent my men from Dorey to Amberbaki, they heard exactly the same story-that the rater sorts were only found several days' journey in the interior, among rugred mountains, and that the skins were prepared by savage tribes who had never even been seen by any of the coast people.

It seems as if Nature hatd taken precations that these her choicest trensurcs should not be mate too common, and thus be undervalued. This northern coast of New Guinea is exposed to the full swell of the Pacific

Gewan，and is rumed and harbouless．The country is all rocky and mountainous，covered everywhere with dense forests，oflering in its swamps and precipices and sermated ridges an almost impasaible barier to the unknown interior；and the people are dangerous savages，in the bery lowest stage of harbarisim．In such a country，and among such a people，are found thase wonderful produc－ tions of Nature，the Birds of Paradise，whose exquisite beaty of form and colour and stramge devalopments of plumare are caleulated to excite the wonler and admira－ tion of the most civilized and the most intellectual of mankind，and to furnish inexhaustible materials for stuly to the naturalist，and for speralation to the philo－ sopher．

Thus emled my searel after these beantiful birds．Five voyages to different parts of the distriet they inhabit，each ocouping in its preparation and exention the larger part of a year，produced me only five species out of the fourteen known to exist in the New Guinea district．The kinds obtained are those that inhabit the coasts of Now Guinea and its islands，the remainder sceming to be strictly con－ fined to the central mountain－ranges of the northern peninsula；and our researches at Dorey and Amberbaki， near one end of this peninsula，and at salwatty and Sorong，near tho other，enable me to decide with some certainty on the native country of these rare and lovely birds，good specimens of which have never yet been seen in Europe．

It must be considered as somewhat extmordinary that， during five years＇residence and travel in Celebes，the Moluceas，and New Guinea，I should never have been able to purebase skins of half the species which Lesson， forty gears ago，oltained during a few weeks in the same countries．I believe that all，except the common species of commerce，are now much more difficult to obtain than they were even twenty years ago ；aud I impute it prinepally to their having been sought after ly the Dutch officials through the Sultan of Tidore．The chiefs of the ammal expeditions to collect tribute have land orders to get all the rare sorts of Paralise Binds；and as they pay littu or nothing for them（it being sulticient to saty they are for
the Sultan), the heal men of the coast villages would for the luture refuse to purchaze them from the mountaineers, and confine themselves instead to the commoner siecies, which are less sought after by amateurs, but are a more profitable merchandise. The same canses frequently lead the inhabitants of uncivilized countries to conceal tumemls or other natural products with which they may become acquainted, from the fear of being obliged to pay increased tribute, or of bringing upon themselves a new and oppressive labour.

## CHAPTER XXXIX.

## THE NATURAL HISTORY OF THE PAPUAN ISLANDS.

NEW GUINEA, witls the islamds jomed to it by a shallow sea, constitute the I'apuan group, chatacterised by a very close resemblance in their peculiar forms of life. Having alrealy, in my chapters on the Aru Islands and on the Birds of Paradise, griven some details of the natural history of this district, I shall hero confine myself to a general slietch of its animal productions, and of their relations to those of the rest of the world.

New Guinea is perhaps the largest island on the globe, being a little larger than Borneo. It is nearly fonteen hundred miles long, and in the widest part fonr hondred broad, and spems to be everywhere covered with luxuriant forests. Almost everything that is yet known of its natural productions cones from the north-western peninsula, and a few islauds grouped around it. 'lluese do not constitute a tentli part of the area of the whole island, and are so cut off trom it, that their fauma may well be somewhat diferent; yet they have prodnced us (with a very partial exploration) no less than two fundred and fifty species of land birds, almost all unknown elsewhere, and comprising some of the most curions and most beatiful of the feathered tribes. It is needless to say how mach interest attaches to the far lager unknown portion of this great island, the greatest tere inoognita that still remains
for the naturalist to explore, and the only region where altogether new and unimarined foms of life may perhaps be foumd. There is now, 1 am happy to say, some chance that this great country will no longer remain absolntely unknown to us. The Dutch Govermment have granted $\Omega$ well-equipped steamer to carry a naturalist (Mr. Roserberg, alrealy mentioned in this work) and assistants to New Gumen, where they are to spend some years in circomnavigating the island, ascending its large rivers as far as possible into the interior, and making extensive collections of its natural productions.

The Mammalin of New Guinea and the aljacent islands, yet discovered, are only seventeen in number. Two of these are bats, one is a pig of a neculiar species (Sus papuensis), and the rest are all marsupials. The bats are, no doubt, much more numerous, but there is every reason to believe that whatever new land Mammalia may be discovered will belong to the marsupial order. Ono of these is a true kangaroo, very similar to some of the middle-sized kangaroos of Australia, and it is remarkatle as being the first anmal of the kiml ever seen by Guropeans. It inhabits Mysol and the Arn Islands an allied species being found in New Guinea, and was seen and described by Le Bron in 1714, from living specimens at Batavia. A much more extramdinary creature is the treekangaroo, two species of which are known from New Guinea. These animals do not liffer very strikingly in form from the tervestrial kangarons, and appear to be but imperfectly adapted to an arboreal life, as they ruove rather slowly, and do not seem to have a very secure footing on the limb of a tree. The leaping power of the muscular tail is lost, and powerful claws have been acquired to assist in climbing, but in other respects the animal seems better udapted to walk on lerra firma. This imperfect adaptation may be due to the fact of there being no carnivom in New Guinea, and no enemies of any kind from which these animals have to eseape by rapid climbing. Four species of Coseus, and the small tlying opossum, also inhabit New Guinea ; and there are five other smaller marsupials, one of which is the size of a rat, and takes its place by entering louses and devouring provisions

The birds of New (iuinea offer the greatest possible contrast to the Mammatia, since they are more numerous, more brantiful, and alford more new, conions, and elegant forms than those of any other island on the globe, besides the Birds of l'aradise, which we have adready sulticiently consilered, it possesses a mumber of other curions birds, which in the cyes of the ornithologist almost serves to distinguish it as one of the primary divisions of the earth. Among its thinty species of parrots are the (ireat Iback Cobsatoo, and the little rigidtailed Nasitema. the giant and the dwarf of the whole tribe. The bare-headed Dasyptilus is one of the most simgular parots linown; while the beatifal little longtailed Chamosyma, and the great variety of gorgeouslycoloured lories, have no parallels elsewhere. Of pipeons it pussesses about forty distinct species, anong which are the marnitient crowned pigeons, now so well known in our aviaries, and pre-eminent both for size and beaty; the curious Truron terestris, which approaches the still more strmge Didunculus of Samon; and a new gemus (Henicophaps), discovered by myself, which possessts a very long and powertul bill, quite unlike that of any other pigeon. Among its sixteen kingtishers, it possesses the curious hook-billed Macrorhina, and a red and blue Tanysiptera, the most beatiful of that beautiful gemus. Among its perehing birds are the fine genms of crow-like starlings, with brilliant plumage (Manucodia); the curious pale-coloured erow (Gymnocorvus senex) ; the abnormal red and back Hyeatcher (Peltops blanvillii) ; the curious little boat-billed tyyatehers (Machaerimynchus) ; and the elegant blue tlycatcher-wrens (Todopsis).

The matardist will obtain a clearer idea of the variety and interest of the productions of this country, by the statement, that its land birds belong to 108 genera, of which 24 are exchusively characteristic of it; while 35 belong to that limited area which includes the Moluceas and North Ausualia, and whose species of these genera have been entirely derived from New Guinea, About one-half of the New Guinea gencra are found also in Australin, about one-third in India and the Indo-Malay islands.

A very curious fact, not hitherto sutticiently noticed, is the appearance of a pure Maliy element in the birds of Nuw Guinea. We find two species of Eupetes, a curions Malayan genus allied to the forked-tail water-chats; two ol Ahippe, an Indian and Malay wren-like forn ; an Arachnothem, quite resembling the spider-eatching honeysurkers of Mitlacea; two species of Cimeula, the Mymahs of India; ant a curious little back Prionochilus, a saw-billed frutpecker, umboubtedly allied to the Malayan form, althom,h: perhaps a distinct genus. Now not one of these binde, of anything ailied to them, oceurs in the Moluceas, or (with one exception) in Celebes or Austratia; aul as they int most of them bivds of short tlight, it is very dillicult th conceive how or when they could have erossed the space of more than a thousthd niles, which now separates then from their nearest allies. Such facts point to chauges of land and sea on a large sale, and at a rate which, measured by the time required for a change of species, must be termed rapid. By speulating on such changen we may easily see how partial waves of jmmigration may have entered New Guinea, and how all trace of than passage may have been obliterated by the subsequent disappearance of the intervening land.

There is nothing that the study of geology teaches us that is more certain or more impressive that the extrente instability of the earth's surface. Everywhere beneath our feet we find proofs that what is land has been sea, and that where oceans now spread out has onee bern laned: and that this change from sea to fand, and from land on sea, has taken place not once or twien only, but again and again, during countless ares of past tine. Now the sthey of the distribution of animal life upmi the present surfike of the earth, causes us to look upun this constant interchange of land and sea-this makiug and umaking of continents, this elevation and lisnmparate of islands-ats a potent reality, which has always and werywhere been in progress, and has been the main agent in determining the manner in which living things are now grouped and sattered over the earth's surface. And when we continually come upon such little anomalies of instribution as that just now described, we find the only ratiomal explanation
of then, in those repeated elevations and denressions which have lelt their reand in mysurions, hat still inteligible characters on the fince of organic nature.

The insects of New Guinea are less known than the birds, lout they seen almost equally remarkable for fine forms and brilliant colons. The magniticent green and yellow Urnithoptere are abuniant, and have most probably spread westward from this point as fir as Lndia Among the sma'ler butterlies are several peculiar genera of Nymphalide and Lycanida, remarkable for their large size, simgular markings, or brilliant coloration. The largest

and most beantiful of the clear-winged moths (Cocytia d'urvillei) is found here, as well as the large and handsome green moth (Nyctalemon orontes). The beetles furnish us with many species of large size, and of the most brilliant metallic lustre, anong which the Thesisternus mimabilis, a longicorn beetle of a golden sreen colour ; the excessively lrilliant rose-chafers, LomapFora wallacei and Anacamptorhina fulyida; one of the handsomest oi the Buprestide, Calodema wallacei; and
several fine blue weevils of the genus Eupholus, are perhaps the most conspicuous. Almost all the other orders furnish us with large or extraordinary forms. The curious horned flies have already been mentioned; and among the Orthoptera the great shielded grasshoppers are the most remarkable. The species here figured (Megalodon ensifer) has the thorax covered by a large triangular horny shield, two and $a$ halt inches long, with serrated edges, a somewhat wavy, hollow surface, and a faint median line, so as very closely to resemble a leaf. The glossy wing-coverts (when fully expanded, more than nine inches across) are of a fine green colour and so beautifully veined as to imitate closely some of the large shining tropical leaves. The body is short, and terminated in the female by a long curved sword-like ovipositor (not seen in the cut), and the legs are all long and strongly-spined. These insects are sluggish in their motions, depending for safety on their resemblance to foliage, their horny shield and wing-coverts, and their spiny legs.

The large islands to the east of New Guinea are very little known, but the occurrence of crimson lories, which are quite absent from Australia, and of cockatoos allied in those of New Guinea and the Moluceas, shows that they belong to the Papuan group; and we are thus able to define the Malay Archipelago as extending castward to the Solomon's Islands. New Caledonia and the New Helrides, on the other hand, seem more nearly allied to Australia; and the rest of the islands of the Pacific, though very poor in all forms of life, possess a few peculiarities which compel us to class them as a separate group. Although as a matter of convenience I have always separated the Moluceas as a distinct zoological group from New Guinea, I have at the same time pointed out that its fauna was chiefly derived from that island, just as that of Timor was chiefly derived from Anstralia. If we were dividing the Australian region for zoological purposes alone, we should form three great groups : one comprising Australia, Timor, and Tasmania; another New Guinea, with the islands from Bouru to the Solomon's group; and the third comprising the greater part of the Pacific Islands.

The relation of the New Guinea fauna to that of

Australia is very close. It is best marked in the Mammadia by the alomatance ol marsupals, and the almost complete absence of all other terrestrial forms. In birds it is less striking, althourh still very clear, lor all the remarkable ohd-work forms which are ahsent from the one are equally so from the other, sheh as I'heasants, Grouse Yaltures, and Woonpeckers; while Cockatuos, Bromb-tailed Parrots, Podargi, and the great families of the Honeysuckers and Brush-turkeys, with many othors, comprising no less than twenty four gerkera of land-birds, are common to both countries, and are entirely contined to them.

When we consider the wonderful dissimilarity of the two regions in all those physical conditions which were once supposed to determine the forms of life-Australia, with its open plains, stony deserts, dried up rivers, and changeable temperate climate; New Guinea, with its luxurinat forests, uniformly hot, moist, and evergreenthis great similarity in their productions is almost astounding, and unnistakeably points to a common orgin. The resemblance is not nearly so strongly marked in insects, the reason obviously being, that this class of animals are much more immediately dependent on vegetation and climate than are the more highly organized birds and Mammalia. Iusects also have far more effective means of distribution, and have spread widely into every district favourable to their development and increase. The giant Ornithoptere have thus spread from New Giunca over the whole Archipelaro, and as far as the base of the Himalayas; while the clegant long-horned Authribide have spread in the opposite direction from Malacea to New Guinea, but owing to unfavourable conditions have not been able to establish themselves in Australia. That country, on the other hand, has developed a variety of llower-haunting Chafers and Buprestidie, and numbers of large and curious terrestrial Weevils, scarcely any of which are adapted to the damp gloomy forests of New Guinea, where entirely different forms are to be found. There are, however, some groups of insects, constituting what appear to be the remains of the ancient population of the equatorial parts of the Australian region, which are still almost entirely confined to $i t$. Such are the interesting sub-family of Longicorn coleoptera- $\rightarrow$
'fimesisternite; one of the best-marked genera of Bupres-tide-Cyphorastra; and the beautiful weevils forming the genus Eupholus. Auong butterflies we have the genera Mynes, Hypocista, and Elodina, and the curious eyespotted Drusilla, of which last a single species is found in Java, but in no other of the western islands.

The facilities for the distribution of plants are still greater than they are for insects, and it is the opinion of aminent botanists, that no such clearly-defined regions can be marked out in botany as in zoology. The causes which tend to diffusion are here most powerful, and have Jed to such intermingling of the floras of adjacent regions that none but broad and geaeral divisions can now be detected. These remarks have an important bearing on the problem of dividing the surface of the earth into great regions, distinguished by the radical difterence of their natural productions. Such difference we now know to be the direct result of long-continued separation by more or less impassable harriers ; and as wide oceans and great contrasts of temperature are the most complete barriers to the dispersal of all terrestrial forms of life, the primary divisions of the earth shonld in the main serve for all terrestrial organisms. However various may be the etlects of climate, however unequal the means of distribution, these will never altogether obliterate the radical effects of long-continued isolation; and it is my firm conviction, that when the botany and the entomology of New Guinea and the surrounding islands become as well known as are their mammals and lirds, these departments of nature will also phanly indicate the radieal distinctions of the Jndo-Malayan and Austro-Malayan regions of the great ITalay Archipelago.

## CHAPTER XL.

## THE RACES OF MAS IN TIIE MALAY ARCIIPLLAGO.

IPROIOSE to conclude this account of my Eastern travels, with a short statement of my views as to the races of man which inhabit the various parts of the Archipelago, their chief physical and mental characteristics, their affinities with each other nad with surrounding tribes, their migrations, and their probable origin.
Two very strongly contrastel races inhabit the Archi-pelago-the Malays, occupying almost exclusively the larger western half of it, and the Pappans, whose headquarters are New Guinea and several of the afjacent islands. Between these in locality, are found tribes who are also intermediate in their chicf characteristics, and it is sometimes a nice point to determine whether they belong to one or the other race, or have been formed by a mixture of the two.

The Malay is undoubtedly the most important of these two races, as it is the one whichs is the most civilized, which has come most into contact with Europeans, and which alone has any place in history. What may be called the true Malay races, as distinguished from others who lave merely a Malay element in their language, present a considerable uniformity of physical and mental characteristics, while there are very great differences of civilization and of language. They consist of four great, and a few minor semi-civilized tribes, and a number of others who may be termed savages. The Malays proper inhabit the Malay peninsula, and almost all the coast regions of Borneo and sumatra. They all speak the Malay language, or dialects of it; they write in the Arabic character, and are Mahometans in religion. The Javanese inlabit Java, part of Sumatra, Madura, Bali, and part of Lombock. They speak the Javanese and Kawi languages, which they write in a native character. They are now Maho-
metans in Java, but Brohmins in Bali and Lomboek. The Bugis are the inhabitints of the greater parts of Celebes, and there scems to be an allied people in Sumbawa. They speak the Pugis and Macassar langunges, with dialects, and have two different native characters in which they write these. They are all Mahometams. The fourth great race is that of the Tagalas in the Philippine Islands, about whom, as I did not visit those Islands, I shall say litule. Many of them are now Christians, and speak Spanish as well as their native tongue, the Tarala. The Mohncean-Malays, who inhabit chiefly Ternate, Tidore, Batchian, and Amboyna, may be held to form a filth divisiou of semi-civilized Malays. They are all Mahometans, but they speak a variety of curious languages, which seem compounded of Bugis and Javanese, with the languages of the savare tribes of the Moluceas.

The savage Malays are the Dyaks of Borneo; the Battaks and other wild tribes of Sumatra; the Jakuns of the Malay Peninsula ; the aborigines of Northern Celebes, of the Sula island, and of part of Bouru.
The colour of all these varied tribes is a light reddish brown, with more or less of an olive tiuge, not varying in any important degree over an extent of country as large as all Southern Europe. The hair is equally constant, being invariably black aud straight, and of a rather coarse texture, so that any lighter tint, or any wave or curl in it, is an almost certain proof of the admixture of some foreign blood. The face is nearly destitute of beard, and the breast and limbs are free from hair. The stature is tolerably equal, and is always considerably below that of the average European; the lody is robust, the lireast well developed, the feet small, thick, and short, the hands small and rather delicate. The face is a little broad, and inclined to be flat ; the forelead is rather rounded, the hrows low, the eyes black and very slightly oblique; the nose is rather small, not prominent, but straight and well-shaped, the apex a little rounded, the nostrils broal and slightly exposeld ; the cheek-bones are rather prominent, the mouth larye, the lips broad and well cut, but not protruding, the chin round and well-formed.

In this descriphon there seems litte to object to on the
seme of leanty, and yet on the whole the Malays are certaindy not handsonc. In youth, however, they are often very good-looking, and many of the hoys and rirls up to twelve or fifteen years of age are very pleasing, and some lave comotemances which are in their way almost perdect. I am inclined to think they lose much of their good looks hy bad habits and irregular living. At a very early age they chew betel and tolaceo almost incessantly; they sulfer much want and exposure in their fishing and other excursions; their lives are often passed in alternate starvation and feasting, idleness and excessive lahomr,-and this maturally produces premature oll age and harshness of features.

In character the Malay is impassive. ITe exhibits a reserve, diffidence, and even bashfulness, which is in some degree attractive, and leads the observer to think that the ferocious and bloolthisty character imputed to the race must be grossly exagrerated. He is mot demonstrative. His feelings of surprise, admiration, ol fear, are never openly manifested, and are probably not strongly folt. He is slow and deliberate in speech, and eirenitous in introducing the sulject he has come expressly to discuse. These are the main features of his moral natite, and oxhibit themselves in every action of his life.

Children and women are tiuid, and scream and run at the unexpected sight of a European. In the company of men they are silent, and are generally quiet and obedient. Wheu alone the Malay is taciturn; he neither talks nor sinus to himself. When several are padding in a canoe, they oceasionally chant a monotonous and plaintive song. He is cautious of giving offence to his equals. He does not quarrel easily about momey matters; dislikes asking 100 frequently even for payment of his just debts, and will often give them up altogether rather than quarrel with his debtor. Practical joking is utterly repugnant to his disposition; for he is particularly seasitive to breaches of ritiquette, or any interference with the personal liberty of himself or another. As an example, I may mention that I have often found it very difficult to get one Malay servant to waken another. He will call as lond as he can. but will harily tonch, much less shake his comrade. I
have frequently had to waken a have sleeper myself when on a land or sea journey.

The higher elasses of Malays are exceedimyly polite, and have all the quiet ease and dignity of the best-bred Luropeans. Yet this is compatible with a reckless cruelty and contempt of human life, which is the dark side of their character. It is not to be wondered at, therefore that different persons give totally opposite accounts of themone praising them for their soberness, civility, and goodnature; another abusing them for their deceit, treachery, and eruelty. The old traveller Nicolo Conti, writing in 1430, says: "The inhalitants of Jawa and Sumatril exseed every other people in cruelty. They regard killing a uan as a mere jest; nor is any punishment alloted for such a deed. If any one purchase a new sword, and wish to try it, he will thrust it into the breast of the lirst person he meets. The passers-by examine the wound, and praise the skill of the person who inflicted it, if he thrust in the weapon direct." let Drake says of the south of Java: "The people (as are their lings) are a very loving, rue, and just-dealing people;" and Mr, Crawfurd says that the Javanese, whom he knew thoronghly, are "a veaceable, docile, sober, simple, and industrious puople." Barbosa, on the other hand, who saw them at Malacea about 1660 , says: "They are a people of great ingenuily, very subtle in all their dealings; very malicions, great leceivers, seldom speaking the truth; prepured to do all manner of wickedness, and ready to satritice their lives."

The intellect of the Malay race seems rather deticient. They are ineapable of anything beyond the simplest combinations of ideas, and have litthe taste or energy for the aequirement of knowledge. Their civilization, such as it is, does not seem to be indigenous, as it is entirely contined to those nations who have been converted to the Mahometan or Brahminical religions.

I will now give an equally braf sketch of the other seat race of the Matay Arehipelago, the Papuan.

The typical Papuan race is in many respects the ver: pposite of the Malay, and it has hitherto been very insweffectly deseribed. The colour of the body is a deept sonty-brown or black, sometimes approaching bat never
quite equalling, the jet-black of some nerro mees. It varies in tint, however, more than that of the Malay, and is sometimes a dusky-brown. The hair is very peculiar, being harsh, dry, and frizzly, growing in little tufts or curls, which in youth are very short and compact, but afterwards grow out to a considerable length, forming the compact frizzled mop which is the I'stpuans' pride and glory. The face is adorned with a beard of the same frizzly nature as the hair of the head. The arms, legs, and breast are also more or less clothed with hair of a similar nature.

In stature the Papuan decidedly surpasses the Malay, and is perhaps equal, or even superior, to the average of Turopeans. The legs are long and thin, and the hands and feet lauger than in the Malays. The face is somewhat elongated, the forehead flattish,

PAPUAS CTIATIZ. the brows very prominent; the nose is large, rather arched and high, the base thick, the nostrils broad, with the aperture hidden, owing to the tip of the nose being clongated; the mouth is large, the lips thick and protuberant. The face has thus an altogether more European aspect than in the Malay, owing to the large nose; and the peculiar form of this organ, with the nore prominent brows and the character of the hair on the head, face, and body, enable us at a glance to distinguish the two races. I have observed that most of these characteristic features are as distinctly visible in children of ten or twelve years old as in adults, and the peculiar form of the nose is always shown in the ligures which they carve for omaments to their houses, or as charms to wear round their necks.

The moral characteristics of the Pipuan appear to me 0 separate him as distinctly from the Malay as do his form
and features. He is impulsive and demonstrative in speech and action. His emotions and passions express themselves in shouts and laughter, in yells and frantio leapiugs. Women and children take their share in every discussion. and seem little alarmed at the sight of strangers and Europeans.

Ol the intellect of this race it is very difficult to juilge, but I am inclined to rate it somewhat higher than that of the Mulays, notwithstanding the fact that the Papuans have never yet made any advance towards civilization. It must be remmbered, however, that for centuries the Malays have been influencel by Hindoo, Chinese, amd Arabic immigration, whereas the Papuan moce has only been subjected to the very partial and local influence of Matay traders. The Papuan has much more vital energy, which would certainly greatly assist his intellectual development. Papuan slaves slow no inferiority of intellect compared with Malays, but rather the contrary; and in the Moluceas they are often promoted to places of considerable trust. The Papuan has a greater feeling for art than the Malay. He decorates his canoe, his house, and almost every domestic utensil with elaborate carving, a habit which is rarely found among tribes of the Malay race.

In the affections and moral sentiments, on the other hand, the Papuans seem very deficient. In the treatment of their children they are often violent and cruel ; wheras the Malays are almost invarially kind and gentle, hardly ever interfering at all with their children's pursuits and amusements, and giving them pertect liberty at whatever age they wish to claim it. Put these very peaceful rela tions between parents aut children are no doubt, in a great measure, due to the listless and apathetic character of the race, which never leads the younger members into serious opposition to the elders: while the harsher disciphine of the P'upuans may be chiefly due to that greater vigene and energy of mind which always, sooner or later, leads to the rebellion of the weaker against the stronger,-the people against their rulers, the slave against his master, or the child against its parent.

It appears, therefore, that, whether we consider their physical contcrmation, their monal chameteristics, or theim
intellectual capacities, the Malay and Papuan races ofter remarkable differeners and striking contrasts. The Malay is of short stature, brown-skinned, straight-haired, beardless, and smooth-bodied. The Papuan is taller, is blackskinned. frizzly-haired, bearded, and hairy-bodied. The former is broad-facet, has a small nose, and flat eyebrows ; the latter is longfaced, has a large and prominent nose, and projecting eycbrows. The Malay is bashful, cold, undemonstrative, and quiet; the Papuan is bold, impetuous, excitable, and noisy. The former is grave and celdom laughs; the latter is joyous and laughter-loving,the one conceals his emotions, the other displays them.

Having thus described in some detail, the great physical, intellectual, and moral differences between the Malays and Papuans, we have to consider the inhabitants of the numprous islands which do not agree very closely with either of these races. The islands of Obi, Batchian, and the three southern peninsulas of Gilolo, possess no true indipenous population; but the northern peninsula is inhahited by a native race, the so-called Alfuros of Sahoe and Galcla. These people are quite distinct from the Malays, and almost equally so from the lopuans. They are tall and well-made, with Papuan features, and curly hair; they are bearded and hairy-limbed, but quite as light in colour as the Malays. They are an industrious and onterprising race, cultivating rice and vegetables, and indefatigable in their search after game, fish, tripang, pearls, and tortoiseshell.

In the great island of Ceram there is also an indigenous race very similar to that of Northern Gilolo. Bouru seems to contain two distinct races, -a shorter, roundfaced people, with a Malay plysiognomy, who may prohably have come from Celebes by way of the Sula islands; and a taller bearded race, resembling that of Cemm.

Far south of the Molnecas lies the island of Timor, inhabited by tribes much nearer to the true Papuan than those of the Moluccas.

The Timorese of the interior are dusky brown or black$j=$, with bushy frizzled hair, and the long Papuan nose. 'Hey are of medium height, and rather slender figures.

The universal dress is a long eloth twisted round the waini, the fringed ends of which hang below the knee. The people are satid to be great thieves, and the tribes art always at war with each other, but they are not very courageots or bloodthirsty. The custom of "tabu," called here "romati," is very general, fruit trees, houses, crops. and property of all kinds being protected from depredation by this cevemony, the reverence for which is very great. A palm branch stuck across an open door, showing that the house is tabooed, is a more effectual guand against robbery than any amount of locks and bars. The houses in Tumor are different from those of most of the other islands; they seen all roof, the thatch overhanging the low walls and reaching the arround, exeept where it is cut. away for an entrance. In some parts of the west end of Timor, and on the little island of Seman, the houses mor. resemble those of the Hottentots, being egrg-shaped, very small, and with a door only about three feet high. Thes: are built on the ground, while those of the eastern district are raised a few feet on posts. In their excitable disposidion, loud voices, and fearless demeanour, the Timorese closely resemble the people of New Guinea.

In the islands west of Timor, as far as Flores amd Sandalwood Island, a very similar race is found, which also extends eastward to Timor-laut, where the true Papuan race begins to appear. The suall islands of Savu and Rotti, however, to the west of Timor, are very remarkable in possessing a different and, in some respects, peculiar race. These people are very handsome, witl ${ }_{3}$ gool features, resembling in many characteristics the race produced by the mixture of the Hindoo or Arab witl the Malay. They are certainly distinct from the Timorese or lapuan races, and must be classed in the western rather than the eastern ethological division of the Archipelago.

The whole of the great island of Now Guinea, the ke and Aru Islands, with Mysol, Salwatty, and Waigion, are inbabited almost exclusively by the typical Papuans. I found no trace of any other tribes inhabiting the interior of New Guinea, but the const people are in some vlaces mixed with the browner races of the Moluccas.

The same Papuan race seems to extend over the ishands east of New Guinea as far as the Fijis.

There remain to be noticed the black woolly-haired races of the Philippines and the Malay peninsula, the former called "Negritos," and the latter "Semangs," I have never seen these people myself, but from the numerous aceurate descriptions of them that have been published, I have had no difficulty in satisfying myself that they have little affinity or resemblance to the l'apuans, with which they have been hitherto associated. In most important characters they difler more from the Papuan than they do from the Malay. 'They are dwarfs in stature, aly averaging four feet six inches to four feet eight incies high, or eight inches less than the Malays; whereas the Papuans are decidedly taller than the Malays. The nose is isvariably represented as small, fattened, or turned up at the apex, whereas the most universal character of the lapuan race is to have the nose promineut and lame, with the apex produced downwards, as it is invariably represented in their own rude idols. The hair of these dwartish races agrees with that of the Papuans, but so it does with that of the negroes of Africa. The Negritos and the Semangs agree very closely in physical charreteristics with each other and with the Andaman islanders, while they diftler in a marked manner from every Papuan race.

A careful study of these varied races, comparing them with those of Eastern Asia, the Pacific Islands, and Australia, has led me to adopt a comparatively simple view as to their origin and affinities.

If we draw a line (see I'hysical Map, p. 9), commencing to the east of the Philippine Islauds, thence along the western coast of Gilolo, through the island of louru, and curving round the west end of Flores, then bending back by Sandalwood Island to take in Rotti, we shall divide the Archipelago into two portions, the races of which have strongly marked distinctive pectliarities. This line will separate the Malayan and all the Asiatic races, from the Papuans and all that inhabit the Pacific; and though along the line of junction intermigration and commisture have taken place, yet the divi-
sinn is on the whole almost as well defined ant strongly contrasten, as is the corresponding zoological division of the Archipelago, into an Indo-Nalayan and AustroMalayan region.

I must briefly explain tho reasons that hase led me to consider this division of the Oceanic races to be a true and natural one. The Malayan race, is a whole, undoubtedly very closely resembles the Fast Asian poptulations, from Siam to Mandchourin. I was much struck with this, when in the island of Bali I saw Chinese traders who had adopted the costume of that country, and who could then hardly be distingtished from Malays ; aul, on the other hand, i have seen natives of Java who, as far as physiognony was concerned, would pass very well for Chinese. Then, again, wo lave the most typiat of the Malayan tribes inlabiting a portion of the Asiatio continent itself, together with those great ishants which, possessing the same species of large Mammalia with the adjacent parts of the continent, have in all probability formod a connected portion of Asia cluring the hmoan period. The Negritos are, no doubt, quite a distinct race from the Malay; but yet, as some of them inhabit a portion of the continent, and others the Andaman Islands in the Bay of Bengal, they must be considere to have Jam, in all probability, an Asiatic mather than a Polynesian origin.

Now, turning to the eastern parts of the Arehipewas, I find, by comparing my own observations with those of the most trustworthy travellers and missiomaries, that a race itentical in all its chief features with the lapuan, is foumd in all the islands as far east as the Fijis; beyond this the hrown Polynesian race, or some intermedate type, is spreal everywhere over the Pacific. The descriptions of these latter often agree exactly with the characters of the brown indigenes of Gilolo and Ceram.

It is to be especially remarked that the brown and the black Polynesian races closely resemble each other. Their features are almost identical, so that portraits of a New Kealander or Otaheitan will often serve accurately to represent a Papuan or Timorese, the darker colour and more frizzly hair of the latter being the only differences.

They are both tall races. They arree in their love of ar: and the style of their deunations. They are energetw, demonstrative, joyous, and langhter-loving, and in all these particulars they differ widely from the Malay.

I believe, therefore, that the numerous intermediate forms that ocemr anong the countless islands of the Pacific, are not merely the result of a mixture of these races, but are, to some extent, truly intermediate or transitional: and that the brown and the black, the Papuan, the matives of Gilolo and Ceram, the Fijian, the inhabitants of the Sandwich Islamds and those of New Zealand, are all varying forms of one great Oceanic or Polynesian race.

It is, howewer, quite possilnle, and perhaps probable, that the brown Polynesians were originally the produce of a mixture of Makays or some lighter coloured Mongol race with the lark Papuans ; but if so, the iutermingling took place at such a remote epoch, and has been so assisted by the continued influence of plyysical conditions and of natural selection, leading to the preservation of a special type suited to those conditions, that it has become a tixed and stable race with no signs of mongrelism, and showin! such a decided preponderance of Papuan character, that it can thest be classified as a molification of the Papuan type. The oceurrence of a decided Malay element in the Polynesian languages, has evidently nothing to do with any such ancient physical connexion. It is altogether a recent phenomenon, originating in the roaming habits of the chief Malay tribes; and this is proved by the fact that we find actual modern words of the Malay anul Javanese languages in use in Polynesia, so little disguised by peculiarities of pronunciation as to be easily recomnisable-not mere Malay roots only to be detected by the elaborate researches of the philologist, as would certainly have been the case liad their introduction been as remote as the orimin of a very distinct race-a race adifferent from the Malay in mental and moral, as it is in. physical characters.

As bearing upon this question it is important to poin: out the harmony which exists, between the line of sepatation of the human maces of the Archipelago and that of
the animal probluctions of the same country, which I have already so fully explaned and illustrated. The dividing lines do mot, it is true, exactly anree; but I think it is a remarkahle fact, and something more than a mere coincidence, that they should traverse the same distriet and approach each other so closely as they do. If, however, I am right in my supposition that the region where the dividing line of the Indo-Malayan and Austro-Malayan regions of zoology can now be drawn, was formerly ocenpied by a much wider sea than at present, anl if man existed on the earth at that period, we shall see gool reason why the races inhabiting the Asiatic and Pacific areas should now meet and partially intermingle in the vicinity of that dividing line.

It has recently been maintained by Professor IIusley, that the Papuans are more closely allied to the negroes of Africa than to any other race. The resemblance both in physical and mental characteristics haul often struck myself, but the difficultes in the way of neceptine it as probable or possible, have hitherto prevented me from giving fall weight to those resemblances. Georraphical, zasological, and ethnological considerations render it ahmost ectrain, that if these two races ever lind a common origin, il conld only have been at a period far wore remote than any which has yet been assigned to the antiquity of the human race. And even if their unity could be proved, it would in no way affect my argument for the close affinty of the Papuan and Polynesian races, and the radical distinctness of both from the Malay.

Polynesia is pre-eminently an areat of subsidence, and its great wile-spread groups of coral-reefs mark out the position of former continents and islands. The rich aud varied, yet strangely isolated productions of Australia and New Guinea, also indicate an extensive continent where such spectalized forms were developed. The races of men now inhabiting these countries are, therefore, most probably the descendants of the races which inhabited these continents and islauds. This is the most simple and natural supposition to make. And if" we find any signs of direct affinty butween the indabitants of any other part of the world and those of lolynesia, it by no means
follows that the latter were derived from the former. For as, when a Pacific continent existed, the whole geography of the earth's surface would probably be very different from what it now is, the present continents may not then have risen above the ocean, and, when they were formed at a subsequent epoch, may have derived some of their inhabitants from the Polynesian area itself. It is undoubtedly true that there are proofs of extensive migrations among the Pacific islands, which have led to community of language from the Sandwich group to New Zealand; but there are no proofs whatever of recent migration from any surrounding country to Polynesia, since there is no people to be found elsewhere sufficiently resembling the Polynesian race in their chief physical and mental characteristics.

If the past history of these varied races is obscure and uncertain, the future is no less so. The true Polynesians, inhabiting the farthest isles of the Pacific, are no doubt doomed to an early extinction. But the more numerous Malay race seems well adapted to survive as the cultivator of the soil, even when his country and government have passed into the hands of Europeans. If the tide of colonization should be turned to New Guinea, there can be little doubt of the early extinction of the Papuan race. A warlike and energetic people, who will not submit to national slavery or to domestic servitude, must disappear before the white man as surely as do the woll and the tiger.

I have now concluded my task. I have given, in more or less detail, a sketch of my eight years' wanderings among the largest and the most luxuriant islands which adorn our earth's surface. I have endeavoured to convey my impressions of their scenery, their vegetation, their animal productions, and their human inhabitants. I have dwelt at sume length on the varied and interesting problems they offer to the student of nature. Before bidding my readers farewell, I wish to make a few observations on a subject of yet higher interest and deeper importance, which the contemplation of savage life has suggested, and on which I believe that the civilized can leara something from the savage man.

We most of us believe that we, the higher races, have progressed and are progressing. If so, there must be some state of perfection, some ultimate goal, which we may never reach, but to which all true progress must bring us nearer. What is this ideally perfect social state towards which mankind ever has been, and still is tending? Our best thinkers maintain, that it is a state of individual freedom and self-government, rendered possible by the equal development and just balance of the intellectual, moral, and physical parts of our nature,-a state in which we shall each be so perfectly fitted for a social existence, by knowing what is right, and at the same time feeling an irresistible impulse to lo what we know to be right, that all laws and all punishments shall be unnecessary. In such a state every man would have a sufficiently well-balanced intellectual organization, to understand the moral law in all its details, and would require no other motive but the free impulses of his own nature to obey that law.

Now it is very remarkable, that among people in a very Jow stage of civilization, we find some approach to such a perfect social state. I have lived with communities of savages in South America and in the East, who have no laws or law courts but the public opinion of the village freely expressed. Each man serupulously respects the rights of his fellow, and any infraction of those rights rarely or never takes place. In such a community, all are nearly equal. There are none of those wide distinctions, of education and ignorance, wealth and poverty, master and servant, which are the product of our civilization; there is none of that wide-spread division of labour, which, while it increases wealth, produces also contlicting interests; there is not that severe competition and struggle for existence, or for wealth, which the dense population of civilized countries inevitably creates. All incitements to great crimes are thus wanting, and petty ones are repressed, partly by the influence of public opinion, but chictly by that natural sense of justice and of his neighbour's right, which seems to be, in some degree, inherent in every race of man.

Now, although we have progressed vastly beyond the
savage state in intellectual achievements, we have not advanced equally in morals. It is true that anong those classes who have no wants that canuot be casily supplied, and among whom public opinion has great intuence, the rights of others are fully respected. It is true, also, that we have vastly extemied the sphere of those rights, and include within them all the brotherhood of man. But it is not too much to say, that the mass of our populations have not at all advanced beyond the savare code of morals, and have in mony cases sunk below it. A deficient morality is the great blot of modern civilization, aud the greatest hindrance to true progress.

During the last century, and especially in the last thirty years, our intellectual and material advancemut has been too quickly achieved for us to reap the full benefit of it. Our mastery over the forces of nature has led to a rapid growth of population, and a vast accumulation of wealth; but these have brought with them such an amount of poverty and crime, and have lostered the growth of so much sordid feeling and so mony fierce passions, that it nay well be questioned, whether the mental and moral status of our population has not on the average been lowered, and whether the evil has not overbalanced the grod. Compared with our wondrous progress in physical science and its practical applications, our system of govermment, of administering justice, of national education, and our whole social and moral organization, remains in a state of barbarism,* And if we continue to devote our chief energies to the utilizing of our knowledge of the laws of nature with the view of still further extending our commerce and our weallh, the evils which necessarily accompany these when too eagerly pursued, may increase to such gigantic dimensions as to be beyond our power to alleviate.

We shouk now clearly recognise the fact, that the wealth and knowledge and culture of the few do not constitute civilization, and do not of themselves advance us towards the "perfect social state." Our vast manufacturing system, our gigantic commerce, our crowded towns and cities, support and continually renew a mass of human

[^9]misery and crime absoluthly greater than has ever existed beture. They ereate and maintain in life-kong labour an ever-increasing army, whose lot is the more hard to bear by contrast with the pleasures, the conforts, and the luxury which they see everywhere around them, hut which they can never hope to enjoy; and who, in this respect, are worse of than the savage in the midst of his tritie.

This is not a result to honst of, or to be satisfied with; and, until there is a more general recognition of this failure of our civilization-resultius manly from our neglect to train and develop more thoroughly the sympathetic feelings and moral faculties of our nature, and to allow them a larger shave of influence in our legislation, our commerce, and our whole social orgamization-we shall never, as regards the whole community, attain to any real or important superionty over the better class of savares.

This is the lesson I havo been tanght by my observations of uncivilized man. I now bid my readersFarewell:

## NOTE.

Trose who believe that our social condition approaches perfection, will think the above word harsh and exaggerated, but it seems to me the only word that can be truly applied to us. We are the richest country in the world, and yet one-twenticth of our population are parish paupers, and one-thirtieth known criminals. Add to these, the criminals who escape letection, and the poor who live mainly on private charity, (which, according to Dr. Hawkesley, expends seven millions sterling annually in London alone, and wo may bo sure that more than ove-texte of our population are actually Paupers and Criminals. Both these classes we keep ille or at unproductive labour, and each criminal costs us annally in our prisons more than the wages of an honeet agricultural labourer. We allow over a hundred thousand persons known to have no means of subsistence but by erime, to remain at large and prey upon the community, and many thousand children to grow up before our eyes in ignormeve and vice to supply trained criminals for the next generation. This, in a country which boasts of its rapil increase in wealth, of its enormous commeree and gigantic manufactures of its mechanical skill and scientifie knowledge, of its high civilization
and its pure Christianity, -I can but term a state of social barbarism. We also boast of our love of justice, and that the law protects rich and poor alike, yet we retain money fines as a punishment, and make the very first steps to obtain justice a watter of expense-in both cases a barbarous injustice, or denial of justice to the poor. Again, our laws render it possible, that, by mere neglect of a legal form, and contrary to his own wish and intention, a man's property may all go to a stranger, and his own children be left destitute. Such cases have happened through the operation of the laws of inheritance of landed property ; and that such unnatural iujustice is possible among us, shows that we are in a state of social barbarism. One more example to justify my use of the term, and I have done. We permit absolute possession of the soil of our country, with no legal rights of existence on the soil, to the vast majority who do not possess it. A great landholder nay legally convert his whole property into a forest or a hunting-ground, and expel every human being who has hitherto lived upon it. In a thicklypopulated country like England, where every acre has its owner and its occunier, this is a power of legally destroying his fellow. creatures; and that such a power should exist, and be exercised by individuals, in however small a degree, indicates that, as regards true social science, we are still ins a state of barbarisin.

## APPENDIX.

## ON THE CRANIA AND THE LANGUAGES OF THE RACES OF MAN IN THE MALAY ABCHIPELAGO.

## crania.

A few years ago it was thought that the study of Cramia offered the only sure basis of a classification of man. Immense collections have been formed; they have been measured, described, and figred; and now the opinion is beginning to gain ground, that for this special purpose they are of very little value. Professor Huxley has boldly stated his views to this offect; and in a proposed now classification of mankind has given scarcely any weight to characters derived from the cranium. It is cortain, too, that though Cranioscopy has been assiduously studied for many years, it has produced no results at all comparable with the labour and research bestowed upon it. No approach to a theory of the excessive variations of the cranium has been put forth, and no intelligiblo classification of races has been founded upon it.

Dr. Joseph Barnard Davis, who has assiduously collected human crania for many years, has just published a remarkable work, ontitled "Thesaurus Craniorum." This is a catalogue of his collection (by far the most extensive in existence), classiffed according to countries and races, indicating the derivation and any special characteristics of each specinen ; and by way of description, an claborate series of measurements, nineteen in number when complete, by which accurate comparisons can be made, and the limits of pariation determined.

This interesting and valuable work offered me the means of determining for myself, whether the forms and dimensions of the crania of the eastern races, would in any way support or refute my classification of them, For the purposes of comparison, the whole series of nincteen measurements would have been far too cumbersome. I therefore selected three, which seem to mo well adapted to test the capabilities of Cranioscopy for the purpose in view. These are:-1. The capacity of the cranium. 2. The proportion of the width to the length taken as 100. 3. The proportion of the height to the length taken as 100 . These dimensions are given by Dr. Iavis in almost every case, and have furnished me with ample materials. I first took the " meana" of groups of crania of the same race from distinct localities, as given by Dr. Davis himself, and thourght I could detect differences charactoristic of the great divisions of the Malaymas and Papuans; but some anomalies induced me to look at the amount of individual variation, and this was bo enormous that I became at onee convinced, that even this large collection could furnish no trustworthy average. I will now give a few examples of these variations, using the terms,-Capacity, W:L, H:L, for the three dimensions comparel. In the Capacity, I always compare only male crania, so as not to introduce the sexual difference of size. In the other proportionate dimensions, I use both sexes to get a lafger average, as I find these proportions do not vary definitely according to sex, the two extremes often occurring in the series of male specimens only.

Malays.-Thirteen male Sumatra crania had:-Capacity, from 615 to 87 ounces of sand; W:L, 71 to 86 ; II:L, . 33 to 85 . Ten male Celebes crania varied thus:-Capacity, from 67 to 83 ; W : L, 73 to 92 ; H: L , 76 to 90 .

In the whole sories of eighty-six Malay skulls from Sumatra, Tava, Madura, Borneo, and Celebes, the variation is enormous. Capacity ( 66 skulls) 60 to 91 ounces of sand; W:L, 70 to $.92 ; \mathrm{H}: \mathrm{L}_{5} \cdot 72$ to 90 . And these extremes are not isolated
abnormal specimens, but there is a regular gradation up to them, which always becomes more perfect the laxger the number of specimens compared. Thus, bestdes the extreme Dolicocephalic skull (70) in the supposed Brachycephalic Malay group, there are others which have $\mathrm{W}: \mathrm{L}, \cdot 71, \cdot 72$ and 73 , so that we have every reason to believe that with more specimens we should get a still narrower form of skull. So the very large cranium, 91 onnces, is led up to by others of 87 and 88 .

The largest, in an extensive series of English, Scotch, and Irish crania, was only 92.5 ounces.

Papuans.-There are only four true Papuan crania in the collection, and these vary considerably (W:L 72 to 83 ). Taking, however, the natives of the Solomon Islands, New Caledonia, New Hebrides, and the Fijis as being all decidedly of Papuan race, we have a series of 28 crania ( 23 male ), and these give us:-Capacity, 66 to 80 ; W:L, '65 to 85 ; $11: L$, .71 to 85 ; so nearly identical with some of the Malayan groups as to offer no clear points of difference.

The Polynesians, the Australians, and tho African negroes offer equally wite ranges of variation, as will be seen by the following summary of the dimentions of the crania of these races and the preceding :-

| Number of Crabia, | Carsetty. | W:L. | II : L. |
| :---: | :---: | :---: | :---: |
| 83. Malays ( 66 male). | 60 to 91 | -70 to 92 | . 72 to 90 |
| 28. Papuans (23 m.). | 66,80 | '65 , 85 | -71 n 85 |
| 156. Polynesians ( 90 mm .) | 62, 121 | -69 , 90 | -68 , '88 |
| 23. Australians (16m.) | $59 \ldots 86$ | . 57 , ${ }^{\text {- }} 80$ | -64 , 80 |
| 72. Negroes ( 38 m .) . | 661,87 | .64 , . 83 | .65 , 81 |

The only conclusions that we can draw from this table are, that the Australians have the smallest crania, and the Polynesians the largest; the Negroes, the Malays, and Papnans not
differing perceptibly in size. And this accords very well with what we know of their meatal activity and capacity for civilization.

The Australians have the longest skills; after which come the Segroes; then the Papuans, the Polynesians, and the Malays.

The Austrulians have also the lowest skulls; then the Negroes; the Polynesians nud Papuans considerably lither and equal, aud the Malay the highest.

It seems probable, therefore, that if we had a much more extensive series of crania the averages might furnish tolerably reliable race-characters, althongh, owing to the large anomat of individual variation, they would never be of any use in single examples, or even when woderate numbers only could be compared.

So far as this series goes, it scems to agree well with the conclusions I have arrived at, from fhysical and mental characters olserved by myselt. These conclusions briefly are: that the Malays and Papuans are radically distinct races; and that the Polynesians are most nearly allied to the latter, although they have probably some admixture of Malayan or Mongolian blood.

## Janguaces.

During my travels among the islands of the Archipelaro, I collected a considerable number of vocabnlaries, in districts hitherto littlo visited. These represent about fifty-seven distinct languages (not including the common Malay and Javonese), more than half of which I believe are quite unknown to philologists, while onty a few seattered words have been recordel of some others. Unlortunately, nearly half the number have been lost. Some yeurs ago I lent the whole series to the late Mr. John Crawford, ant having neglected to apily for then for sowe months, I found that he had in the meantime changed his residence, and that tho books, containing twenty-tive of the wocabularics, had been mislaid; and they have never since been recovered. Being murely old and much battered copy-books, they probably found
their way to the dust-heap along with other waste paper, I had previously copied out nine common words in the whole series of languages, and these are here given, as well as the remaining thirty-one vocabularies in full.

Having befure had experience of the difficulty of satisfactorily deternining any words but nouns and a few of the commonest adjectives, where the people are complete savages and the language of communication but imperfectly known, I selected about a hundred and twenty words, and have adhered to them throughout as far as practicable. After the English, I give the Malay worl for comparison with the other languages. In orthography I adopt generally the continental mode of sounding the vowels, with a fow modifications, thus:-

| English .... a e ior ie ei o ŭ <br> Sounded....ah a ee i o éoréh |
| :---: |
|  |  |

These sounds come out most prominently at the end of a syllable; when followed by a consonant the sounds are very little different from tho usual pronnmeiation. Thus, " $A$ pi" is pronounced Appee, while "Minta" is pronounced Nintah. The short ŭ is pronounced like er in Euglish, but without any trace of the guttuml. Long, short, and accented syllables are marked in the usual way. The languages are grouped geouraphieally, passing from west to east; those from the same or adjacent islands being as much as possible kept together.

I profess to be able to draw very few conclusions from these vocabularies. I believe that the languages have been so much modified by long intercommunication among the islands, that resemblances of words are no proof of affinity of the people who use those words. Many of the wide-spread similarities can be traced to organic onomatopeia. Such are the prevalence of $g$ (hard), $n g, n i$, in words meaning "tooth;" of $l$ and $m$ in those for "tongue;" of $n g e$, ang, sno, in those fur "nose." Others are plainly commercial words, as "salaka" and
"ringgit" (the Malay word for clollar) for silver, and "mas" for gold. The Papuan group of lauguages appear to be distinguished by harsher combinations of lettere, and by monosyllabic words ending in a consonant, which are rarely or never found in the Malay group. Some of the tribes who are decidedly of Malay race, as the people of Ternate, Tidore, and Batchian, spenk languages which are as decifedly of a Papuan type; and this, I believe, arises from their having originally immigrated to these islands in small numbers, and by marrying native women acquired a considerable portion of their language, which later arrivals of Malays were obliged to learn and adopt if they settled in the country. As I have hardly mentioned in my narrative some of the names of the tribes whose languages are here given, I will now give a list of them, with such explanatory remarks as I may think useful to the ethologist, and then leave the vecabularies to speak for themselves.

## list of vocabularies colaected

Those marked *are lost

1. Malay.-The common colloquial Malay as spoken in Singapore; written in the Arabic character.
2. Javanese.-Low or colloqual Javanese as spoken in Java; written in a native character:
*3. Sassak. -Spoken by tho indigenes of Lombock, who are Mahometans, and of a pure Malay race.
*. Macassar.-Spoken in the district of Southern Celebes, near Macassar ; written in a native character. Mahometans.
*5. Bugis.-Spoken over a large part of Southern Celebes ; written in a native character distinct from that of Macassar. Mahometans.
3. Bouton.-Spoken in Houtong, a large island south of Celebes. Mahometans
4. Salayer.-Spoken in Salayer, a smaller island south of Celelies. Mahometans.
*8. Tomore.-Spoken in the eastern pexinsula of Celehes, and in Batehian, by emigrants who have settled there. Pagans,
Note-The people who speak these five languages of Celehes are of pure Malayan type, and (all but the last) are equal in civilization to the true Malays.
*9. Tomohon; *10. Langowen.-Villages on the platent of Minslasa.
*11. Ratahan; *12. Belang.-Villages near the soutl-cast coast of Minahasa. *13. Tanawanko.-On the west const. *14. Kema.-On the east const. *15. Bantek. - A suburb) of Menado.
5. Menado.-'The chief town. 17. Bolang-hitam.-A village on the north-west coast, hetween Menado and Licoupang.
These nine languares, with many others, are spoken in the north-west peninsula of Culebes, by the people callel Alfuros, who are of Molay race, and seem to have affinities with the Tagalas of the Philippines through the Sanguir islanders. Thrse languages are falling into disuse, and Malay is becoming the universal means of communication. Most of tho people are being converted to Cluristianity.
6. Sanguir Islands and Siau.-Two groups of islands between Celebes and the Pliilippines. The inhahitants wear a peculiar costume, consisting of a loose cotton gown langing from the neck nearly to the feet. They resemble, physically, the people of Menado.
7. Salibabo Islands, aleo called Talaut. - This rombulary was given me from memory by Captain Van der Beck. See page 39.
8. Sula Islands.-These are situated east of Celeles, and their inhabitants seem to be Malays of the Molucean tyle, and are Mahometans.
9. Cajeli ; 22. Wayapo; 23. Massaratty,-These are
three villages on the eastem side of Bouru. The people are allied to the natives of Ceram. Those of Cajeli itself are Mahometans.
10. Amblan. - An island a little south-east of Bouru. Mahometans.
*25. Ternate. -The northernmost island of the Molncens. The inlabitants are Mahometans of Malay race, but somewhat mixed with the indigenes of Gilolo.
11. Tidore.-The next island of the Moluceas. The inlalitants are undistinguishable from those of Ternate.
*27. Kaióa Islands.-A small group north of Batchian.
*28. Batchian. - Inbabitants like the preceding. Mahometans, and of a similar Malay type.
12. Gani. - A village on the south peninsula of Gilolo. Inhabitants, Moluecan-Malays, and Mahometans.
*30. Sahoe; 31. Galela.-Villages of Northern Gilolo. The inhabitants aro called Alfuros. They are indigenes of Polynesian type, with brown skins, but Papunn lair and features. Pagaus.
13. Liang. - $A$ village on the north const of Amboyna. Several other villages near spenk the same language. They aro Mahometans or Christians, and seem to be of mixed Malay and Polynesian type.
14. Morella and Mamalla. - Villages in North-West Amboyna. The inhabitants are Mahometans.
15. Batu-merah. - A suburb of Amboyna. Inhabitants Mahometans, and of Moluccan-Malay type.
16. Lariki, Asilulu, Wakasiho.-Villages in West Amboyna inhahited by Mahometans, who are reported to have come nriginally from Ternate.
17. Saparua.-An island east of Amboyna. Inhabitants of the brown Polynesian type, and speaking the same language as those on the const of Ceram opposite.
18. Awaiya; 38. Camarian.-Villages on the south coast of Ceran. Inhabitants indigenes of Polynesian type, now Christiana.
19. Teluti and Hoya; 40. Ahtiago and Tobo.-Villages on the south coast of Ceram. Inhabitants Mahometans, of mixed brown Papuan or Polynesian and Malay type.
20. Ahtiago.-Alfuras or indigenes inland from this village. Pagans, of Polynesian or brown Papuan type.
21. Gah.-Alfuros of East Ceram.
22. Wahai.-Inhabitnots of much of the north coast of Ceram. Mahometans of mixed race. Speak several dialects of this language.
*4. Goram.--Small islands east of Ceram. Inhabitants of mixed race, and Mahometans.
23. Matabello.-Small islands southeast of Goram. Inhabitants of brown Papuan or Polynesian type. Pagans.
24. Teor.-A small istand south-enst of Matabello. Inhabitants a tall race of brown Papuans. Pagans.
*47. Ké Islands. -A small group west of the Arn Islands, Inhabitants true black Papuans. Paraus.
*48. Aru Islands. - A group west of New Guinea. Inhabitants true Papuans. Pagans.
25. Mysol (coast). - An island north of Ceram. Inhahitants Papuans with mixture of Moluccan Malays. Semi-civilized.
26. Mysol (interior).-Inhabitants true Papuans. Savages.
*51. Dorey.-North coast of New Guinea. Inhabitants true Papuans. Pagans,
*52. Teto ; *53. Vaiqueno, East Timor; *34. Brissi, West Timor:-Inhalitants somewhat intermediate between the true and the brown Papuans. Pagans.
*55. Savu; *56. Rotti.-Islauls west of Timor. Inhabitants of mixed race, with apparently much of the Findoo type.
*57. Allur; *58. Solor. - Islands between Flores and Timor. Inhabitants of dark Papuan type.
27. Bajau, or Sea Gipsies.-A ronming tribo of fishermen of Malayan type, to be met with in all parts of the Arelipelago.

TEE MAGNTFICEHT BLRD OF PATADIgx (DGhyltodet gpeciosi.)

THE BIX-BHAFTED BURD OF FARADISE, (Parotia suppenifi)

[^0]:    

[^1]:    I I was informal, howere, that there were a few corkatoos at one spot on tho west of Bati, showing that the intermingling of the productions of these ishund is now going on.

[^2]:    1 (harlog Allen, an English lad of sixteen, aceompanied ne us nom assintant

[^3]:     ook. i. p. 290

[^4]:    ${ }^{1}$ The former las bern named Eronia tritan ; the latter Tachyris ithome.

[^5]:    1 The following are a few of the Portuguese words in common use by the Malay-speaking natives of Amboyna and the other Moheca islands: I'onto (pigeon); milo (maize); testa (forehead); horas (hours); allinete (pitu); cateita (chair); longo (handkerchief); troseo (cool); trigo (thour); sonto (sleep); familia (fimily); histori (talk); vusse (you); mesmo (even) ; cuñludo (brother-in-law); senhor (siry); nyora for signora (nadum). -Nom of them, however, have the jeast notion that theso wards belong to a European language.

[^6]:    1 Soon after I left the Archipelano, on the $29 t h$ of Deremher, 1862 , another eruption of this mountain sudilenly took place, which caused great devastation in the island. All the villages and crojes were deatroyed, and mumpers of the inhahitants killed. The sand and nshes fell so thick that the pops were partially destroyed fifty milus off, at Terate, where it was so dark the following dioy that lansps had to be lighted at nooir. For the josition of this and the adjacent ishadis, see the map in Chapter XXXYM.

[^7]:    

[^8]:    ${ }^{1}$ See tho upper figure on Plate at commencerment of Chaptor x.xyill.

[^9]:    - See note next page.

[^10]:    "Charmingly written, full, as zolght he expected, of incident, andi free fron that wearioneme reiteration of usetess facts which is the dmuback to aimost all houks of African travel."-Spectator.

[^11]:    ESSAYS ON ART. Extra lcap. 8vo. 6r
    Mulready-Dyci-Holman Hunt-Herbert-Potry, Prose, and Sensationalism in Art-Stulture in Enghni-The Albry Cross, Soc.

[^12]:    Hales.-LONGER ENGLISII POEMS. With Notes, Philological and Explanatory; and an Introduction on the Teaching of English. Chiefly for use in Schools. Edited by J. W. Hales, M.A., late Fellows and Assistant Tutor of Christ's College, Cambridge ; Lecturer in English Literature and Classical Composition at King's College Scirool, London; Sc. \&c. Thard Edition. Extra icap. Svo. 45. 6d.
